- B. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.

#### 1.2 SUMMARY

- A. This section includes commissioning process requirements for Electrical systems, assemblies, and equipment.
- B. Related Sections
  - 1. Division 01 for general commissioning process requirements.

#### 1.3 DESCRIPTION

- A. Refer to Division 01 for the description of commissioning.

#### 1.4 DEFINITIONS

- A. Refer to Division 01 for definitions.

#### 1.5 SUBMITTALS

- A. Refer to Division 01 for CxA's role.
- B. Refer to Division 01 for specific requirements.
- C. In addition, provide the following:
  - 1. Certificates of readiness.
  - 2. Certificates of completion of installation, prestart, and startup activities.
  - 3. O&M manuals.
  - 4. Test reports.

#### 1.6 QUALITY ASSURANCE

- A. Test Equipment Calibration Requirements: Contractors will comply with test manufacturer's calibration procedures and intervals. Recalibrate test instruments immediately after instruments have been repaired resulting from being dropped or damaged. Affix calibration tags to test instruments. Furnish calibration records to CxA upon request.

## 1.7 COORDINATION

- A. Refer to Division 01 for requirements pertaining to coordination during the commissioning process.

## PART 2 - PRODUCTS

### 2.1 TEST EQUIPMENT

- A. All standard testing equipment required to perform startup, initial checkout and functional performance testing shall be provided by the Contractor for the equipment being tested. For example, the electrical contractor of Division 26 shall ultimately be responsible for all standard testing equipment for the electrical systems and controls systems in Division 26. A sufficient quantity of two-way radios shall be provided by each contractor.
- B. Special equipment, tools and instruments (specific to a piece of equipment and only available from vendor) required for testing shall be included in the base bid price to the Owner and left on site, except for stand-alone data logging equipment that may be used by the CxA.
- C. Proprietary test equipment and software required by any equipment manufacturer for programming and/or start-up, whether specified or not, shall be provided by the manufacturer of the equipment. Manufacturer shall provide the test equipment, demonstrate its use, and assist in the commissioning process as needed. Proprietary test equipment (and software) shall become the property of the Owner upon completion of the commissioning process.
- D. Data logging equipment and software required to test equipment will be provided by the CxA, but shall not become the property of the Owner.
- E. All testing equipment shall be of sufficient quality and accuracy to test and/or measure system performance with the tolerances specified in the Specifications. If not otherwise noted, the following minimum requirements apply: Temperature sensors and digital thermometers shall have a certified calibration within the past year to an accuracy of 0.5 deg. F and a resolution of  $\pm 0.1$  deg. F. Pressure sensors shall have an accuracy of  $\pm 2.0$  percent of the value range being measured (not full range of meter) and have been calibrated within the last year.

## PART 3 - EXECUTION

### 3.1 GENERAL DOCUMENTATION REQUIREMENTS

- A. With assistance from the installing contractors, the CxA will prepare Pre-Functional Checklists for all commissioned components, equipment, and systems
- B. Red-lined Drawings:
  - 1. The contractor will verify all equipment, systems, instrumentation, wiring and components are shown correctly on red-lined drawings.
  - 2. Preliminary red-lined drawings must be made available to the Commissioning Team for use prior to the start of Functional Performance Testing.
  - 3. Changes, as a result of Functional Testing, must be incorporated into the final as-built drawings, which will be created from the red-lined drawings.

4. The contracted party, as defined in the Contract Documents will create the as-built drawings.
- C. Operation and Maintenance Data:
1. Contractor will provide a copy of O&M literature within 45 days of each submittal acceptance for use during the commissioning process for all commissioned equipment and systems.
  2. The CxA will review the O&M literature once for conformance to project requirements.
  3. The CxA will receive a copy of the final approved O&M literature once corrections have been made by the Contractor.
- D. Demonstration and Training:
1. Contractor will provide demonstration and training as required by the specifications.
  2. A complete training plan and schedule must be submitted by the Contractor to the CxA four weeks (4) prior to any training.
  3. A training agenda for each training session must be submitted to the CxA one (1) week prior the training session.
  4. The CA shall be notified at least 72 hours in advance of scheduled tests so that testing may be observed by the CA and Owner's representative. A copy of the test record shall be provided to the CA, Owner, and Architect.
  5. Engage a Factory-authorized service representative to train Owner's maintenance personnel to adjust, operate, and maintain specific equipment.
  6. Train Owner's maintenance personnel on procedures and schedules for starting and stopping, trouble shooting, servicing, and maintaining equipment.
  7. Review data in O&M Manuals.
- E. Systems manual requirements
1. The Systems Manual is intended to be a usable information resource containing all of the information related to the systems, assemblies, and Commissioning Process in one place with indexes and cross references.
  2. The GC shall include final approved versions of the following information for the Systems Manual:
    - a. As-Built System Schematics.
    - b. Verified Record Drawings.
    - c. Test Results (not otherwise included in Cx Record).
    - d. Periodic Maintenance Information for computer maintenance management system.
    - e. Recommendations for recalibration frequency of sensors and actuators.
    - f. A list of contractors, subcontractors, suppliers, architects, and engineers involved in the project along with their contact information.
    - g. Training Records, Information on training provided, attendees list, and any on-going training.
  3. This information shall be organized and arranged by building system, such as fire alarm, chilled water, heating hot water, etc.

4. Information should be provided in an electronic version to the extent possible. Legible, scanned images are acceptable for non-electronic documentation to facilitate this deliverable.

### 3.2 CONTRACTOR'S RESPONSIBILITIES

- A. Perform commissioning tests at the direction of the CxA.
- B. Attend construction phase controls coordination meetings.
- C. Participate in Electrical systems, assemblies, equipment, and component maintenance orientation and inspection as directed by the CxA.
- D. Provide information requested by the CxA for final commissioning documentation.
- E. Include requirements for submittal data, operation and maintenance data, and training in each purchase order or sub-contract written.
- F. Prepare preliminary schedule for Electrical system orientations and inspections, operation and maintenance manual submissions, training sessions, equipment start-up and task completion for owner. Distribute preliminary schedule to commissioning team members.
- G. Update schedule as required throughout the construction period.
- H. During the startup and initial checkout process, execute the related portions of the prefunctional checklists for all commissioned equipment.
- I. Assist the CxA in all verification and functional performance tests.
- J. Provide measuring instruments and logging devices to record test data, and provide data acquisition equipment to record data for the complete range of testing for the required test period.
- K. Gather operation and maintenance literature on all equipment, and assemble in binders as required by the specifications. Submit to CxA 45 days after submittal acceptance.
- L. Coordinate with the CxA to provide 48-hour advance notice so that the witnessing of equipment and system start-up and testing can begin.
- M. Notify the CxA a minimum of two weeks in advance of the time for start of the testing and balancing work. Attend the initial testing and balancing meeting for review of the official testing and balancing procedures.
- N. Participate in, and schedule vendors and contractors to participate in the training sessions.
- O. Provide written notification to the CM/GC and CxA that the following work has been completed in accordance with the contract documents, and that the equipment, systems, and sub-system are operating as required.
  1. Electrical equipment including switchgear, panel boards, motor control centers, lighting, receptacles, dimmers and all other equipment furnished under this Division.
  2. Emergency generators, ATS switches and emergency power systems.
  3. Fire alarm system.
  4. Lightning protection.
- P. The equipment supplier shall document the performance of his equipment.

- Q. Provide a complete set of red-lined drawings to the CxA prior to the start of Functional Performance Testing.
- R. Provide training of the Owner's operating staff using expert qualified personnel, as specified.
- S. Equipment Suppliers
  - 1. Provide all requested submittal data, including detailed start-up procedures and specific responsibilities of the Owner, to keep warranties in force.
  - 2. Assist in equipment testing per agreements with contractors.
  - 3. Provide information requested by CxA regarding equipment sequence of operation and testing procedures.
- T. Refer to Division 01, General Commissioning Requirements for additional Contractor responsibilities.

### 3.3 OWNER'S RESPONSIBILITIES

- A. Refer to Division 01, General Commissioning Requirements for Owner's Responsibilities.

### 3.4 DESIGN PROFESSIONAL'S RESPONSIBILITIES

- A. Refer to Division 01, General Commissioning Requirements for Design Professional's Responsibilities.

### 3.5 CXA'S RESPONSIBILITIES

- A. Refer to Division 01, General Commissioning Requirements for CxA's Responsibilities.

### 3.6 TESTING PREPARATION

- A. Certify in writing to the CxA that Electrical systems, subsystems, and equipment have been installed, calibrated, and started and are operating according to the Contract Documents.
- B. Certify in writing to the CxA that Electrical instrumentation and control systems have been completed and calibrated, that they are operating according to the Contract Documents, and that pretest set points have been recorded.
- C. Certify in writing that testing procedures have been completed and that testing reports have been submitted, discrepancies corrected, and corrective work approved.
- D. Place systems, subsystems, and equipment into operating mode to be tested (e.g., normal shutdown, normal auto position, normal manual position, unoccupied cycle, emergency power, and alarm conditions).
- E. Inspect and verify the position of each device and interlock identified on checklists.
- F. Check safety cutouts, alarms, and interlocks with smoke control and life-safety systems during each mode of operation.
- G. Testing Instrumentation: Install measuring instruments and logging devices to record test data as directed by the CxA.

### 3.7 GENERAL TESTING REQUIREMENTS

- A. Provide technicians, instrumentation, and tools to perform commissioning test at the direction of the CxA.
- B. Scope of Electrical testing shall include the entire Electrical installation, from the incoming power equipment throughout the distribution system. Testing shall include measuring, but not limited to resistance, voltage, and amperage of system(s) and devices.
- C. Test all operating modes, interlocks, control responses, and responses to abnormal or emergency conditions, and verify proper response of building automation system controllers and sensors.
- D. The CxA along with the Electrical contractor and other contracted subcontractors, including the fire alarm Subcontractor shall prepare detailed testing plans, procedures, and checklists for Electrical systems, subsystems, and equipment.
- E. Tests will be performed using design conditions whenever possible.
- F. Simulated conditions may need to be imposed using an artificial load when it is not practical to test under design conditions. Before simulating conditions, calibrate testing instruments. Provide equipment to simulate loads. Set simulated conditions as directed by the CxA and document simulated conditions and methods of simulation. After tests, return settings to normal operating conditions.
- G. The CxA may direct that set points be altered when simulating conditions is not practical.
- H. The CxA may direct that sensor values be altered with a signal generator when design or simulating conditions and altering set points are not practical.
- I. If tests cannot be completed because of a deficiency outside the scope of the Electrical system, document the deficiency and report it to the Owner. After deficiencies are resolved, reschedule tests.
- J. If the testing plan indicates specific seasonal testing, complete appropriate initial performance tests and documentation and schedule seasonal tests.

### 3.8 ELECTRICAL SYSTEMS, SUBSYSTEMS, AND EQUIPMENT TESTING PROCEDURES

- A. Equipment Testing and Acceptance Procedures: Testing requirements are specified in individual Division 26 sections. Provide submittals, test data, inspector record, infrared camera and certifications to the CA.
- B. Electrical Instrumentation and Control System Testing: Field testing plans and testing requirements are specified in Division 26 Sections "Instrumentation and Control" and "Sequence of Operations" Assist the CxA with preparation of testing plans.
- C. Emergency Generator Testing and Acceptance Procedures: Provide technicians, load banks, infrared cameras, instrumentation, tools and equipment to test performance of designated systems and devices at the direction of the CxA. The CxA shall determine the sequence of testing and testing procedures for each equipment item and pipe section to be tested.
- D. Fire Detection and Alarm System Testing: Provide technicians, instrumentation, tools and equipment to test performance of designated systems and devices at the direction of the CxA. The CxA shall determine the sequence of testing and testing procedures for each equipment item and pipe section to be tested.

- E. Electrical Distribution System Testing: Provide technicians, load banks, infrared cameras, instrumentation, tools and equipment to test performance of designated systems and devices at the direction of the CxA. The CxA shall determine the sequence of testing and testing procedures for each equipment item and pipe section to be tested
  - F. Vibration and Sound Tests: Provide technicians, instrumentation, tools, and equipment to test performance of vibration isolation and seismic controls.
  - G. The work included in the commissioning process involves a complete and thorough evaluation of the operation and performance of all components, systems and sub-systems. The following equipment and systems shall be evaluated:
    - 1. Automatic temperature controls integrated with the electrical systems
    - 2. Coordination and functionality with the Building Automation System/Building Management Controls System.
    - 3. Access Control.
    - 4. Automatic Transfer Switch.
    - 5. Battery Monitoring System.
    - 6. CCTV.
    - 7. Emergency Generator.
    - 8. Emergency Power System.
    - 9. EPO System.
    - 10. Fire Alarm System.
    - 11. Grounding System.
    - 12. Lighting Controls.
    - 13. Lightning Protection System.
    - 14. Switchboard.
    - 15. Panelboard.
    - 16. Power Distribution System.
    - 17. Metering System.
    - 18. Security System.
    - 19. Transformer.
- 3.9 DEFICIENCIES/NON-CONFORMANCE, COST OF RETESTING, FAILURE DUE TO MANUFACTURER DEFECT
- A. Refer to Division 01, General Commissioning Requirements for requirements pertaining to deficiencies/non-conformance, cost of retesting, or failure due to manufacturer defect.
- 3.10 APPROVAL
- A. Refer to Division 01, General Commissioning Requirements for approval procedures.

3.11 DEFERRED TESTING

- A. Refer to Division 01, General Commissioning Requirements for requirements pertaining to deferred testing.

3.12 OPERATION AND MAINTENANCE MANUALS

- A. The Operation and Maintenance Manuals shall conform to Contract Documents requirements as stated in Division 01.
- B. Refer to Division 01, General Commissioning Requirements for the AE and CxA roles in the Operation and Maintenance Manual contribution, review and approval process.

3.13 TRAINING OF OWNER PERSONNEL

- A. Refer to Division 01, General Commissioning Requirements for requirements pertaining to training.
- B. Electrical Contractor. The electrical contractor shall have the following training responsibilities:
  - 1. Provide the CA with a training plan two weeks before the planned training.
  - 2. Provide designated Owner personnel with comprehensive training in the understanding of the systems and the operation and maintenance of each major piece of commissioned electrical equipment or system.
  - 3. Training shall start with classroom sessions, if necessary, followed by hands on training on each piece of equipment, which shall illustrate the various modes of operation, including startup, shutdown, fire/smoke alarm, power failure, etc.
  - 4. During any demonstration, should the system fail to perform in accordance with the requirements of the O&M manual or sequence of operations, the system will be repaired or adjusted as necessary and the demonstration repeated.
  - 5. The appropriate trade or manufacturer's representative shall provide the instructions on each major piece of equipment. This person may be the start-up technician for the piece of equipment, the installing contractor or manufacturer's representative. Practical building operating expertise as well as in-depth knowledge of all modes of operation of the specific piece of equipment are required. More than one party may be required to execute the training.
  - 6. The training sessions shall follow the outline in the Table of Contents of the operation and maintenance manual and illustrate whenever possible the use of the O&M manuals for reference.
  - 7. Training shall include:
    - a. Use the printed installation, operation and maintenance instruction material included in the O&M manuals.
    - b. Include a review of the written O&M instructions emphasizing safe and proper operating requirements, preventative maintenance, special tools needed and spare parts inventory suggestions. The training shall include start-up, operation in all modes possible, shut-down, seasonal changeover and any emergency procedures.
    - c. Discuss relevant health and safety issues and concerns.

- d. Discuss warranties and guarantees.
  - e. Cover common troubleshooting problems and solutions.
  - f. Explain information included in the O&M manuals and the location of all plans and manuals in the facility.
  - g. Discuss any peculiarities of equipment installation or operation.
- 8. Hands-on training shall include start-up, operation in all modes possible, including manual, shut-down and any emergency procedures and preventative maintenance of all pieces of equipment.
  - 9. The electrical contractor shall fully explain and demonstrate the operation, function and overrides of any local packaged controls, not controlled by the central control system.
  - 10. Training shall occur after functional testing is complete, unless approved otherwise by the Owner's.

END OF SECTION

H:\Y0586.00\DOC\SPEC\2025\_02-20\_IFB\260800\_COMMISSIONING.DOC

## SECTION 260943 - NETWORK LIGHTING CONTROLS

### PART 1 - GENERAL

#### 1.1 RELATED DOCUMENTS

- A. Certain requirements common to all the mechanical and electrical trades (Fire Suppression, Plumbing, HVAC, Electrical, and Tele/Data) are specified in Division 20. To avoid repetition, they are not repeated in each relevant Division of the Specifications. However, these requirements are applicable to the work of this Division, and are hereby incorporated by reference.
- B. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.

#### 1.2 SUMMARY

- A. This Section includes distributed digital lighting controls with manually operated lighting controls, occupancy sensors, daylight sensors and with digital room control modules featuring relays and control models.

#### 1.3 DEFINITIONS

- A. BACnet: A networking communication protocol that complies with ASHRAE 135.
- B. BAS: Building automation system.
- C. Low Voltage: As defined in NFPA 70 for circuits and equipment operating at less than 50 V or for remote-control, signaling and power-limited circuits.
- D. Monitoring: Acquisition, processing, communication, and display of equipment status data, metered electrical parameter values, power quality evaluation data, event and alarm signals, tabulated reports, and event logs.
- E. PC: Personal computer; sometimes plural as "PCs."
- F. RS-485: A serial network protocol, similar to RS-232, complying with TIA/EIA-485-A.

#### 1.4 SUBMITTALS

- A. Product Data: For control modules, power distribution components, manual switches and plates, and conductors and cables.
- B. Shop Drawings: Detail assemblies of standard components, custom assembled for specific application on this Project.
  - 1. Outline Drawings: Indicate dimensions, weights, arrangement of components, and clearance and access requirements.
  - 2. Block Diagram: Show interconnections between components specified in this Section and devices furnished with power distribution system components. Indicate data communication paths and identify networks, data buses, data gateways, concentrators, and other devices to be used. Describe characteristics of network and other data communication lines.

3. Wiring Diagrams: Power, signal, and control wiring. Coordinate nomenclature and presentation with a block diagram.
- C. Coordination Drawings: Submit evidence that lighting controls are compatible with connected monitoring and control devices and systems specified in other Sections.
  1. Show interconnecting signal and control wiring and interfacing devices that prove compatibility of inputs and outputs.
  2. For networked controls, list network protocols and provide statements from manufacturers that input and output devices meet interoperability requirements of the network protocol.
- D. Field quality-control test reports.
- E. Operation and Maintenance Data: For lighting controls to include in emergency, operation, and maintenance manuals.
- F. Warranty: Special warranty specified in this Section.

#### 1.5 QUALITY ASSURANCE

- A. Source Limitations: Obtain lighting control module and power distribution components through one source from a single manufacturer.
- B. Electrical Components, Devices, and Accessories: Listed and labeled as defined in NFPA 70, Article 100, by a testing agency acceptable to authorities having jurisdiction, and marked for intended use.
- C. Comply with 47 CFR, Subparts A and B, for Class A digital devices.
- D. Comply with NFPA 70.

#### 1.6 COORDINATION

- A. Coordinate lighting control components to form an integrated interconnection of compatible components.
  1. Match components and interconnections for optimum performance of lighting control functions.
  2. Coordinate lighting controls with BAS. Design display graphics showing building areas controlled; include the status of lighting controls in each area.
- B. Coordinate lighting control components specified in this Section with components specified in Division 26.

#### 1.7 WARRANTY

- A. Special Warranty: Manufacturer's standard form in which manufacturer agrees to repair or replace components of lighting controls that fail in materials or workmanship or from transient voltage surges within specified warranty period.
  1. Failures include, but are not limited to, the following:
    - a. Failure of software input/output to execute switching or dimming commands.
    - b. Failure of modular relays to operate under manual or software commands.

- c. Damage of electronic components due to transient voltage surges.
- 2. Warranty Period: Five years from date of Substantial Completion.
- 3. Extended Warranty Period Failure Due to Transient Voltage Surges: Eight years.
- 4. Extended Warranty Period for Electrically Held Relays: 10 years from date of Substantial Completion.

## **PART 2 - PRODUCTS**

### **2.1 MANUFACTURERS**

- A. Available Manufacturers: Subject to compliance with requirements, manufacturers offering products that may be incorporated into the Work include, but are not limited to, the following:
  - 1. NLight; Acuity Lighting Group, Inc.
  - 2. Watt Stopper (The).
  - 3. Or approved equal.

### **2.2 SYSTEM REQUIREMENTS**

- A. Expandability: System shall be capable of increasing the number of control functions in the future by 25 percent of current capacity; to include equipment ratings, housing capacities, spare relays and terminals.
- B. Performance Requirements (digital room controllers): Manual switch operation, automatic occupancy sensor operation, and automatic daylight sensors will send signals to programmable-system room control module(s) that process the signals according to its programming and routes an open or close command to one or more relays, or variable commands to one or more dimmer relays in the power-supply circuits to groups of lighting fixtures or other loads.
- C. BAS Interface: Provide hardware and software to enable the BAS to monitor, control, display, and record data for use in processing reports.
  - 1. Hardwired Points:
    - a. Monitoring: On-off status.
  - 2. ASHRAE 135 (BACnet) or Modbus communication interface with the BAS shall enable the BAS operator to remotely control and monitor lighting from a BAS operator workstation. Control features and monitoring points displayed locally at lighting panel shall be available through the BAS.

### **2.3 CONTROL MODULE**

- A. Digital Room Control Module Description: Comply with UL 916 (CSA C22.2, No. 205); microprocessor-based, solid-state control unit. Unit shall be programmable for control of indicated number of output circuits. Output circuits shall be switched or dimmed as indicated on drawings by digital signals from external sources. Output circuits shall be switched or dimmed by relays. Modules shall include the following features:
  - 1. Multichannel output with indicated number of channels.

2. Multiple inputs for indicated occupancy sensors, daylight sensors and hand-held programming device.
3. 0-10V dimming: where indicated, one 0-10V analog output per relay for control of compatible ballast and LED drivers. The 0-10 volt output shall automatically open upon loss of power to the room controller to assure the full light output from the controlled lighting. Capable of providing Class 1 or 2 wiring for 0-10V output signal.
4. Triac-based forward phase dimming: where indicated, one forward phase control line voltage output per relay for control of compatible two-wire or three-wire ballasts, LED drivers, MLV, forward phase compatible ELV, neon/cold cathode and incandescent loads. The forward phase output shall automatically open upon loss of power to the room controller to assure the full light output from the controlled lighting.

## 2.4 MANUAL SWITCHES AND PLATES

- A. Push-Button Switches: Modular, momentary-contact, low-voltage type.
  1. Match color specified in Division 26.
  2. Integral green LED pilot light to indicate when circuit is on.
- B. Wall-Box Dimmers: seven bi-level LEDs to indicate load levels using 14 steps.
- C. Wall Plates: Single and multigang plates as specified in Division 26.
- D. Legend: Engraved or permanently silk-screened on wall plate where indicated. Use designations indicated on Drawings.

## 2.5 OCCUPANCY SENSORS

- A. General Description: Wall- or ceiling-mounting, solid state units with a separate relay unit.
  1. Operation: Unless otherwise indicated, turn lights on when covered area is occupied and off when unoccupied; with a time delay for turning lights off, adjustable over a minimum of 1 to 15 minutes.
  2. Mounting: Suitable for mounting in any position on a standard outlet box.
  3. Indicator: LED, to show when motion is being detected during testing and normal operation of the sensor.
  4. Bypass switch: Override the on function in case of sensor failure.
- B. Dual-Technology Type: Wall or ceiling mounting; detect occupancy by using a combination of PIR and ultrasonic detection methods in area of coverage. Particular technology or combination of technologies that controls on-off functions shall be selectable in the field by operating controls on unit.
  1. Sensitivity Adjustment: Separate for each sensing technology.
  2. Detector Sensitivity: Detect occurrences if 6-inch-minimum movement of any portion of a human body that presents a target of not less than 36 sq. in., and detect a person of average size and weight moving not less than 12 inches in either a horizontal or vertical manner at an approximate speed of 12 inches/s.
  3. Detection Coverage (Standard Room): Detect occupancy anywhere within a circular area of 1000 sf when mounted on a 96-inch-high ceiling.

## 2.6 DAYLIGHTING SENSORS

- A. Solid-state, light-level sensor unit to detect changes in lighting levels that are perceived by the eye. Cadmium sulfide photoresistors are not acceptable.
  - 1. Light-Level Monitoring Range: 100 to 1000 fc, with an adjustment for turn-on and turn-off levels within that range.
  - 2. Time Delay: Adjustable from 5 to 300 seconds to prevent cycling, with dead band adjustment.
  - 3. Indicator: Two LEDs to indicate the beginning of on-off cycles.

## 2.7 EMERGENCY BYPASS RELAY

- A. Emergency lighting control unit, UL 924 Listed, monitors a switched circuit providing normal lighting to an area. The unit provides normal on-off control of emergency lighting along with the normal lighting. Upon normal power failure, the emergency lighting circuit will close, forcing the emergency lighting on until normal power is restored.

## 2.8 CONDUCTORS AND CABLES

- A. Power Wiring to Supply Side of Class 2 Power Source: Not smaller than No. 12 AWG, complying with Division 26.
- B. Classes 2 and 3 Control Cables: Multiconductor cable with copper conductors not smaller than No. 18 AWG, complying with Division 26.
- C. Class 1 Control Cables: Multiconductor cable with copper conductors not smaller than No. 14 AWG, complying with Division 26.
- D. Digital and Multiplexed Signal Cables: Unshielded, twisted-pair cable with copper conductors, complying with TIA/EIA-568-B.2, Category 5e for horizontal copper cable and with Division 27.

# PART 3 - EXECUTION

## 3.1 WIRING INSTALLATION

- A. Comply with NECA 1.
- B. Wiring Method: Install wiring in raceways except where installed in accessible ceilings and gypsum board partitions. Comply with Division 26. Minimum conduit size shall be 1/2 inch.
- C. Wiring within Enclosures: Bundle, lace, and train conductors to terminal points. Separate power-limited and non-power-limited conductors according to conductor manufacturer's written instructions.
- D. Size conductors according to lighting control device manufacturer's written instructions, unless otherwise indicated.
- E. Splices, Taps, and Terminations: Make connections only on numbered terminal strips in terminal cabinets, equipment enclosures, and in junction, pull, and outlet boxes.
- F. Identify components and power and control wiring according to Division 26.

### 3.2 FIELD QUALITY CONTROL

- A. Manufacturer's Field Service: Engage a factory-authorized service representative to inspect, test, and adjust field-assembled components and equipment installation, including connections, and assist in field testing. Report results in writing.
- B. Perform the following field tests and inspections and prepare test reports:
  - 1. Test for circuit continuity.
  - 2. Verify that the control module features are operational.
  - 3. Check operation of local override controls.
  - 4. Test system diagnostics by simulating improper operation of several components selected by Architect.

### 3.3 ADJUSTING

- A. Occupancy Adjustments: When requested within 12 months of date of Substantial Completion, provide on-site assistance in adjusting sensors and to assist Owner's personnel in making program changes to suit actual occupied conditions. Provide up to three visits to Project during other than normal occupancy hours for this purpose.

### 3.4 DEMONSTRATION

- A. Engage a factory-authorized service representative to train Owner's maintenance personnel to adjust, operate, and maintain lighting controls. Refer to Division 01.

END OF SECTION

H:\Y0586.00\DOC\SPEC\2025\_02-20\_IFB\260943 FL - NETWORK LIGHTING CONTROLS.DOC

## SECTION 262200 - LOW-VOLTAGE TRANSFORMERS

### PART 1 - GENERAL

#### 1.1 RELATED DOCUMENTS

- A. Certain requirements common to all the mechanical and electrical trades (Fire Suppression, Plumbing, HVAC, Electrical, and Tele/Data) are specified in Division 20. To avoid repetition, they are not repeated in each relevant Division and Section. However, these requirements are applicable to the work of this Section and are hereby incorporated by reference.
- B. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.

#### 1.2 SUMMARY

- A. This Section includes the following types of dry-type transformers rated 600 V and less, with capacities up to 1000 kVA:
  - 1. Distribution transformers.

#### 1.3 SUBMITTALS

- A. Product Data: Include rated nameplate data, capacities, weights, dimensions, minimum clearances, installed devices and features, and performance for each type and size of transformer indicated.
- B. Shop Drawings: Detail equipment assemblies and indicate dimensions, weights, loads, required clearances, method of field assembly, components, and location and size of each field connection.
  - 1. Wiring Diagrams: Power, signal, and control wiring.
- C. Source quality-control test reports.
- D. Field quality-control test reports.
- E. Operation and Maintenance Data: For transformers to include in emergency, operation, and maintenance manuals.

#### 1.4 QUALITY ASSURANCE

- A. Source Limitations: Obtain each transformer type through one source from a single manufacturer.
- B. Electrical Components, Devices, and Accessories: Listed and labeled as defined in NFPA 70, Article 100, by a testing agency acceptable to authorities having jurisdiction, and marked for intended use.
- C. Comply with IEEE C57.12.91, "Test Code for Dry-Type Distribution and Power Transformers."

1.5 DELIVERY, STORAGE, AND HANDLING

- A. Temporary Heating: Apply temporary heat according to manufacturer's written instructions within the enclosure of each ventilated-type unit, throughout periods during which equipment is not energized and when transformer is not in a space that is continuously under normal control of temperature and humidity.

1.6 COORDINATION

- A. Coordinate size and location of concrete bases with actual transformer provided. Cast anchor-bolt inserts into bases. Concrete, reinforcement, and formwork requirements are specified in Division 03.
- B. Coordinate installation of wall-mounting and structure-hanging supports with actual transformer provided.

PART 2 - PRODUCTS

2.1 MANUFACTURERS

- A. Available Manufacturers: Subject to compliance with requirements, manufacturers offering products that may be incorporated into the Work include, but are not limited to, the following:
  - 1. ACME Electric Corporation; Power Distribution Products Division.
  - 2. Challenger Electrical Equipment Corp.; a division of Eaton Corp.
  - 3. Controlled Power Company.
  - 4. Eaton Electrical Inc.; Cutler-Hammer Products.
  - 5. Federal Pacific Transformer Company; Division of Electro-Mechanical Corp.
  - 6. ABB-General Electric.
  - 7. Hammond Co.; Matra Electric, Inc.
  - 8. Magnetek Power Electronics Group.
  - 9. Micron Industries Corp.
  - 10. Myers Power Products, Inc.
  - 11. Siemens Energy & Automation, Inc.
  - 12. Sola/Hevi-Duty.
  - 13. Square D; Schneider Electric.
  - 14. Or approved Equal

2.2 GENERAL TRANSFORMER REQUIREMENTS

- A. Description: Factory-assembled and -tested, air-cooled units for 60-Hz service.
- B. Cores: Grain-oriented, non-aging silicon steel.
- C. Coils: Continuous windings without splices except for taps.

1. Internal Coil Connections: Brazed or pressure type.
2. Coil Material: Aluminum.

## **2.3 DISTRIBUTION TRANSFORMERS**

- A. Comply with NEMA ST 20, and list and label as complying with UL 1561.
- B. Cores: One leg per phase.
- C. Enclosure: Ventilated, NEMA 250, Type 2.
  1. Core and coil assembly shall be impregnated with non-hydroscopic, thermosetting varnish and cured to reduce hot spots and seal out moisture.
- D. Transformer Enclosure Finish: Comply with NEMA 250.
  1. Finish Color: Gray.
- E. Taps for Transformers Smaller Than 3 kVA: One 5 percent tap above normal full capacity.
- F. Taps for Transformers 7.5 to 24 kVA: One 5 percent tap above and one 5 percent tap below normal full capacity.
- G. Taps for Transformers 25 kVA and Larger: Two 2.5 percent taps above and two 2.5 percent taps below normal full capacity.
- H. Insulation Class: 220 deg C, UL-component-recognized insulation system with a maximum of 115 deg C rise above 40 deg C ambient temperature.
- I. Energy Efficiency for Transformers Rated 15 kVA and Larger:
  1. Complying with NEMA TP 1, Class 1 efficiency levels.
  2. Tested according to NEMA TP 2.
- J. Low-Sound-Level Requirements: Maximum sound levels, when factory tested according to IEEE C57.12.91, as follows:
  1. 9 kVA and Less: 40 DBA
  2. 30 to 50 kVA: 45 DBA
  3. 51 to 150 kVA: 50 DBA

## **2.4 IDENTIFICATION DEVICES**

- A. Nameplates: Engraved, laminated-plastic or metal nameplate for each distribution transformer, mounted with corrosion-resistant screws. Nameplates and label products are specified in Division 26.

## **2.5 SOURCE QUALITY CONTROL**

- A. Test and inspect transformers according to IEEE C57.12.91.
- B. Factory Sound-Level Tests: Conduct sound-level tests on equipment for this Project.

## **PART 3 - EXECUTION**

### **3.1 EXAMINATION**

- A. Examine conditions for compliance with enclosure- and ambient-temperature requirements for each transformer.
- B. Verify that field measurements are as needed to maintain working clearances required by NFPA 70 and manufacturer's written instructions.
- C. Examine walls, floors, roofs, and concrete bases for suitable mounting conditions where transformers will be installed.
- D. Verify that ground connections are in place and requirements in Division 26 have been met. Maximum ground resistance shall be 10 ohms at location of transformer.
- E. Proceed with installation only after unsatisfactory conditions have been corrected.

### **3.2 INSTALLATION**

- A. Install wall-mounting transformers level and plumb with wall brackets fabricated by transformer manufacturer.
- B. Construct concrete bases and anchor floor-mounting transformers according to manufacturer's written instructions and requirements in Division 26.

### **3.3 CONNECTIONS**

- A. Ground equipment according to Division 26.
- B. Connect wiring according to Division 26.

### **3.4 FIELD QUALITY CONTROL**

- A. Perform tests and inspections and prepare test reports.
- B. Tests and Inspections:
  - 1. Perform each visual and mechanical inspection and electrical test stated in NETA Acceptance Testing Specification. Certify compliance with test parameters.
- C. Remove and replace units that do not pass tests or inspections and retest as specified above.
- D. Infrared Scanning: Two months after Substantial Completion, perform an infrared scan of transformer connections.
  - 1. Use an infrared-scanning device designed to measure temperature or detect significant deviations from normal values. Provide documentation of device calibration.
  - 2. Perform 2 follow-up infrared scans of transformers, one at 4 months and the other at 11 months after Substantial Completion.
  - 3. Prepare a certified report identifying transformer checked and describing results of scanning. Include notation of deficiencies detected, remedial action taken, and scanning observations after remedial action.
- E. Test Labeling: On completion of satisfactory testing of each unit, attach a dated and signed "Satisfactory Test" label to tested component.

3.5 ADJUSTING

- A. Record transformer secondary voltage at each unit for at least 48 hours of typical occupancy period. Adjust transformer taps to provide optimum voltage conditions at secondary terminals. Optimum is defined as not exceeding nameplate voltage plus 10 percent and not being lower than nameplate voltage minus 3 percent at maximum load conditions. Submit recording and tap settings as test results.
- B. Connect buck-boost transformers to provide nameplate voltage of equipment being served, plus or minus 5 percent, at secondary terminals.
- C. Output Settings Report: Prepare a written report recording output voltages and tap settings.

3.6 CLEANING

- A. Vacuum dirt and debris; do not use compressed air to assist in cleaning.

H:\Y0586.00\DOC\SPEC\2025\_02-20\_IFB\262200\_LOW VOLTAGE TRANSFORMERS.DOC

## SECTION 262413 - SWITCHBOARDS

### PART 1 - GENERAL

#### 1.1 RELATED DOCUMENTS

- A. Certain requirements common to all the mechanical and electrical trades (Fire Suppression, Plumbing, HVAC, Electrical, and Tele/Data) are specified in Division 20. To avoid repetition, they are not repeated in each relevant Division and Section. However, these requirements are applicable to the work of this Section and are hereby incorporated by reference.
- B. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.

#### 1.2 SUMMARY

- A. Section Includes:
  - 1. Service and distribution switchboards rated 600 V and less.
  - 2. Transient voltage suppression devices.
  - 3. Disconnecting and overcurrent protective devices.
  - 4. Instrumentation.
  - 5. Control power.
  - 6. Accessory components and features.
  - 7. Identification.

#### 1.3 SUBMITTALS

- A. Product Data: For each type of switchboard, overcurrent protective device, transient voltage suppression device, ground-fault protector, accessory, and component indicated. Include dimensions and manufacturers' technical data on features, performance, electrical characteristics, ratings, accessories, and finishes.
- B. Shop Drawings: For each switchboard and related equipment.
  - 1. Include dimensioned plans, elevations, sections, and details, including required clearances and service space around equipment. Show tabulations of installed devices, equipment features, and ratings.
  - 2. Detail enclosure types for types other than NEMA 250, Type 1.
  - 3. Detail bus configuration, current, and voltage ratings.
  - 4. Detail short-circuit current rating of switchboards and overcurrent protective devices.
  - 5. Detail utility company's metering provisions with indication of approval by utility company.
  - 6. Detail features, characteristics, ratings, and factory settings of individual overcurrent protective devices and auxiliary components.

7. Include time-current coordination curves for each type and rating of overcurrent protective device included in switchboards. Submit electronically; include selectable ranges for each type of overcurrent protective device.
8. Include schematic and wiring diagrams for power, signal, and control wiring.
- C. Qualification Data: For qualified Installer.
- D. Field Quality-Control Reports:
  1. Test procedures used.
  2. Test results that comply with requirements.
  3. Results of failed tests and corrective action taken to achieve test results that comply with requirements.
- E. Operation and Maintenance Data: For switchboards and components to include in emergency, operation, and maintenance manuals. In addition to items specified in Division 01, include the following:
  1. Routine maintenance requirements for switchboards and all installed components.
  2. Manufacturer's written instructions for testing and adjusting overcurrent protective devices.
  3. Time-current coordination curves for each type and rating of overcurrent protective device included in switchboards.

#### 1.4 QUALITY ASSURANCE

- A. Installer Qualifications: An employer of workers qualified as defined in NEMA PB 2.1 and trained in electrical safety as required by NFPA 70E.
- B. Testing Agency Qualifications: Member company of NETA or an NRTL.
  1. Testing Agency's Field Supervisor: Currently certified by NETA to supervise on-site testing.
- C. Source Limitations: Obtain switchboards, overcurrent protective devices, components, and accessories from single source from single manufacturer.
- D. Product Selection for Restricted Space: Drawings indicate maximum dimensions for switchboards including clearances between switchboards and adjacent surfaces and other items. Comply with indicated maximum dimensions.
- E. Electrical Components, Devices, and Accessories: Listed and labeled as defined in NFPA 70, by a qualified testing agency, and marked for intended location and application.
- F. Comply with NEMA PB 2.
- G. Comply with NFPA 70.
- H. Comply with UL 891.

#### 1.5 DELIVERY, STORAGE, AND HANDLING

- A. Deliver switchboards in sections or lengths that can be moved past obstructions in delivery path.
- B. Handle and prepare switchboards for installation according to NEMA PB 2.1.

**1.6 PROJECT CONDITIONS**

- A. Installation Pathway: Remove and replace access fencing, doors, lift-out panels, and structures to provide pathway for moving switchboards into place.
- B. Environmental Limitations:
  - 1. Do not deliver or install switchboards until spaces are enclosed and weathertight, wet work in spaces is complete and dry, work above switchboards is complete, and temporary HVAC system is operating and maintaining ambient temperature and humidity conditions at occupancy levels during the remainder of the construction period.
  - 2. Rate equipment for continuous operation under the following conditions unless otherwise indicated:
    - a. Ambient Temperature: Not exceeding 104 deg F.
    - b. Altitude: Not exceeding 6600 feet.
- C. Interruption of Existing Electric Service: Do not interrupt electric service to facilities occupied by Owner or others unless permitted under the following conditions and then only after arranging to provide temporary electric service according to requirements indicated:
  - 1. Notify Owner no fewer than 14 days in advance of proposed interruption of electric service.
  - 2. Indicate method of providing temporary electric service.
  - 3. Do not proceed with interruption of electric service without Construction Manager's written permission.
  - 4. Comply with NFPA 70E.

**1.7 COORDINATION**

- A. Coordinate layout and installation of switchboards and components with other construction that penetrates walls or is supported by them, including electrical and other types of equipment, raceways, piping, encumbrances to workspace clearance requirements, and adjacent surfaces. Maintain required workspace clearances and required clearances for equipment access doors and panels.
- B. Coordinate sizes and locations of concrete bases with actual equipment provided. Cast anchor-bolt inserts into bases. Concrete, reinforcement, and formwork requirements are specified in Division 03.

**1.8 WARRANTY**

- A. Special Warranty: Manufacturer's standard form in which manufacturer agrees to repair or replace transient voltage suppression devices that fail in materials or workmanship within specified warranty period.
  - 1. Warranty Period: Five years from date of Substantial Completion.

**1.9 EXTRA MATERIALS**

- A. Furnish extra materials that match products installed and that are packaged with protective covering for storage and identified with labels describing contents.

1. Potential Transformer Fuses: Equal to 10 percent of quantity installed for each size and type, but no fewer than two of each size and type.
2. Control-Power Fuses: Equal to 10 percent of quantity installed for each size and type, but no fewer than two of each size and type.
3. Fuses for Fused Switches: Equal to 10 percent of quantity installed for each size and type, but no fewer than three of each size and type.

## **PART 2 - PRODUCTS**

### **2.1 MANUFACTURED UNITS**

- A. Manufacturers: Subject to compliance with requirements, available manufacturers offering products that may be incorporated into the Work include, but are not limited to, the following:
  1. Eaton Electrical Inc.; Cutler-Hammer Business Unit.
  2. ABB-General Electric; GE Consumer & Industrial - Electrical Distribution.
  3. Siemens Energy & Automation, Inc.
  4. Square D; a brand of Schneider Electric.
  5. Or approved equal.
- B. Front-Connected, Front-Accessible Switchboards:
  1. Main Devices: Fixed, individually mounted.
  2. Branch Devices: Panel mounted.
  3. Sections front and rear aligned.
- C. Nominal System Voltage: 208Y/120 V.
- D. Main-Bus Continuous: as shown on drawings.
- E. Indoor Enclosures: Steel, NEMA 250, Type 1.
- F. Enclosure Finish for Indoor Units: Factory-applied finish in manufacturer's standard gray finish over a rust-inhibiting primer on treated metal surface.
- G. Barriers: Between adjacent switchboard sections.
- H. Utility Metering Compartment: Fabricated, barrier compartment and section complying with utility company's requirements; hinged sealed door; buses provisioned for mounting utility company's current transformers and potential transformers or potential taps as required by utility company. If separate vertical section is required for utility metering, match and align with basic switchboard. Provide service entrance label and necessary applicable service entrance features.
- I. Customer Metering Compartment: A separate customer metering compartment and section with front hinged door, for indicated metering, and current transformers for each meter. Current transformer secondary wiring shall be terminated on shorting-type terminal blocks.
- J. Bus Transition and Incoming Pull Sections: Matched and aligned with basic switchboard.
- K. Hinged Front Panels: Allow access to circuit breaker, metering, accessory, and blank compartments.
- L. Buses and Connections: Three phase, four wire unless otherwise indicated.

1. Phase- and Neutral-Bus Material: Hard-drawn copper of 98 percent conductivity, silver-plated, with tin-plated aluminum or copper feeder circuit-breaker line connections.
2. Load Terminals: Insulated, rigidly braced, runback bus extensions, of same material as through buses, equipped with mechanical connectors for outgoing circuit conductors. Provide load terminals for future circuit-breaker positions at full-ampere rating of circuit-breaker position.
3. Ground Bus: Minimum-size required by UL 891, hard-drawn copper of 98 percent conductivity, equipped with mechanical connectors for feeder and branch-circuit ground conductors. For busway feeders, extend insulated equipment grounding cable to busway ground connection and support cable at intervals in vertical run.
4. Main Phase Buses and Equipment Ground Buses: Uniform capacity for entire length of switchboard's main and distribution sections. Provide for future extensions from both ends.
5. Neutral Buses: 100 percent of the ampacity of phase buses unless otherwise indicated, equipped with mechanical connectors for outgoing circuit neutral cables. Brace bus extensions for busway feeder neutral bus.

## 2.2 TRANSIENT VOLTAGE SUPPRESSION DEVICES

- A. Manufacturers: Subject to compliance with requirements, available manufacturers offering products that may be incorporated into the Work include, but are not limited to, the following:
  1. Eaton Electrical Inc.; Cutler-Hammer Business Unit.
  2. ABB-General Electric; GE Consumer & Industrial - Electrical Distribution.
  3. Siemens Energy & Automation, Inc.
  4. Square D; a brand of Schneider Electric.
  5. Or approved equal.
- B. Surge Protection Device Description: IEEE C62.41-compliant, integrally mounted, plug-in, solid-state, parallel-connected, modular (with field-replaceable modules) type, with sine-wave tracking suppression and filtering modules, UL 1449, second edition, short-circuit current rating matching or exceeding the switchboard short-circuit rating, and with the following features and accessories:
  1. Fuses, rated at 200-kA interrupting capacity.
  2. Fabrication using bolted compression lugs for internal wiring.
  3. Redundant suppression circuits.
  4. Redundant replaceable modules.
  5. Arrangement with wire connections to phase buses, neutral bus, and ground bus.
  6. LED indicator lights for power and protection status.
  7. Audible alarm, with silencing switch, to indicate when protection has failed.
  8. Form-C contacts rated at 5 A and 250-V ac, one normally open and one normally closed, for remote monitoring of system operation. Contacts shall reverse position on failure of any surge diversion module or on opening of any current-limiting device. Coordinate with building power monitoring and control system.

9. Six-digit, transient-event counter set to totalize transient surges.
- C. Peak Single-Impulse Surge Current Rating: 160 kA per mode/320 kA per phase.
- D. Withstand Capabilities: 12,000 IEEE C62.41, Category C3 (10 kA), 8-by-20-mic.sec. surges with less than 5 percent change in clamping voltage.
- E. Protection modes and UL 1449 SVR for grounded wye circuits with 208Y/120-V, three-phase, four-wire circuits shall be as follows:
  1. Line to Neutral: 400 V for 208Y/120.
  2. Line to Ground: 400 V for 208Y/120.
  3. Neutral to Ground: 400 V for 208Y/120.

### 2.3 DISCONNECTING AND OVERCURRENT PROTECTIVE DEVICES

- A. Molded-Case Circuit Breaker (MCCB): Comply with UL 489, with interrupting capacity to meet available fault currents.
  1. Electronic trip circuit breakers with rms sensing; field-replaceable rating plug or field-replicable electronic trip; and the following field-adjustable settings:
    - a. Instantaneous trip.
    - b. Long- and short-time pickup levels.
    - c. Long- and short-time time adjustments.
    - d. Ground-fault pickup level, time delay, and  $I^2t$  response.
  2. GFCI Circuit Breakers: Single- and two-pole configurations with Class A ground-fault protection (6-mA trip).
  3. Ground-Fault Equipment Protection (GFEP) Circuit Breakers: Class B ground-fault protection (30-mA trip).
  4. Molded-Case Circuit-Breaker (MCCB) Features and Accessories:
    - a. Standard frame sizes, trip ratings, and number of poles.
    - b. Lugs: Mechanical style, suitable for number, size, trip ratings, and conductor material.
    - c. Application Listing: Appropriate for application; Type SWD for switching fluorescent lighting loads; Type HID for feeding fluorescent and high-intensity discharge (HID) lighting circuits.
    - d. Ground-Fault Protection: Integrally mounted relay and trip unit with adjustable pickup and time-delay settings, push-to-test feature, and ground-fault indicator.
- B. Bolted-Pressure Contact Switch: Operating mechanism uses rotary-mechanical-bolting action to produce and maintain high clamping pressure on the switch blade after it engages the stationary contacts.
  1. Manufacturers: Subject to compliance with requirements, available manufacturers offering products that may be incorporated into the Work include, but are not limited to, the following:
    - a. Boltswitch, Inc.

- b. Eaton Electrical Inc.; Cutler-Hammer Business Unit.
  - c. Pringle Electrical Manufacturing Company, Inc.
  - d. Siemens Energy & Automation, Inc.
  - e. Square D; a brand of Schneider Electric.
  - f. Or approved equal.
- 2. Main-Contact Interrupting Capability: Minimum of 12 times the switch current rating.
- 3. Operating Mechanism: Manual handle operation to close switch; stores energy in mechanism for opening and closing.
  - a. Electrical Trip: Operation of lever or push-button trip switch, or trip signal from ground-fault relay or remote-control device, causes switch to open.
  - b. Mechanical Trip: Operation of mechanical lever, push button, or other device causes switch to open.
- 4. Auxiliary Switches: Factory installed, single pole, double throw, with leads connected to terminal block, and including one set more than quantity required for functional performance indicated.
- 5. Service-Rated Switches: Labeled for use as service equipment.
- 6. Ground-Fault Relay: Comply with UL 1053; self-powered type with mechanical ground-fault indicator, test function, tripping relay with internal memory, and three-phase current transformer/sensor.
  - a. Configuration: Integrally mounted relay and trip unit with adjustable pickup and time-delay settings, push-to-test feature, and ground-fault indicator.
  - b. Internal Memory: Integrates the cumulative value of intermittent arcing ground-fault currents and uses the effect to initiate tripping.
  - c. No-Trip Relay Test: Permits ground-fault simulation test without tripping switch.
  - d. Test Control: Simulates ground fault to test relay and switch (or relay only if "no-trip" mode is selected).
- 7. Open-Fuse Trip Device: Arranged to trip switch open if a phase fuse opens.
- C. Fused Switch: NEMA KS 1, Type HD; clips to accommodate specified fuses; lockable handle.
- D. Fuses are specified in Division 26.

## 2.4 INSTRUMENTATION

- A. Instrument Transformers: IEEE C57.13, NEMA EI 21.1, and the following:
  - 1. Potential Transformers: IEEE C57.13; 120 V, 60 Hz, single secondary; disconnecting type with integral fuse mountings. Burden and accuracy shall be consistent with connected metering and relay devices.
  - 2. Current Transformers: IEEE C57.13; 5 A, 60 Hz, secondary; wound type; single secondary winding and secondary shorting device. Burden and accuracy shall be consistent with connected metering and relay devices.
  - 3. Control-Power Transformers: Dry type, mounted in separate compartments for units larger than 3 kVA.

4. Current Transformers for Neutral and Ground-Fault Current Sensing: Connect secondary wiring to ground overcurrent relays, via shorting terminals, to provide selective tripping of main and tie circuit breaker. Coordinate with feeder circuit-breaker, ground-fault protection.
- B. Multifunction Digital-Metering Monitor: Microprocessor-based unit suitable for three- or four-wire systems and with the following features:
  1. Switch-selectable digital display of the following values with maximum accuracy tolerances as indicated:
    - a. Phase Currents, Each Phase: Plus or minus 1 percent.
    - b. Phase-to-Phase Voltages, Three Phase: Plus or minus 1 percent.
    - c. Phase-to-Neutral Voltages, Three Phase: Plus or minus 1 percent.
    - d. Megawatts: Plus or minus 2 percent.
    - e. Megavars: Plus or minus 2 percent.
    - f. Power Factor: Plus or minus 2 percent.
    - g. Frequency: Plus or minus 0.5 percent.
    - h. Accumulated Energy, Megawatt Hours: Plus or minus 2 percent; accumulated values unaffected by power outages up to 72 hours.
    - i. Megawatt Demand: Plus or minus 2 percent; demand interval programmable from five to 60 minutes.
    - j. Contact devices to operate remote impulse-totalizing demand meter.
  2. Mounting: Display and control unit flush or semiflush mounted in instrument compartment door.

## 2.5 CONTROL POWER

- A. Control Circuits: 120-V ac, supplied through disconnecting devices.
- B. Control-Power Fuses: Primary and secondary fuses for current-limiting and overload protection of transformer and fuses for protection of control circuits.
- C. Control Wiring: Factory installed, with bundling, lacing, and protection included. Provide flexible conductors for No. 8 AWG and smaller, for conductors across hinges, and for conductors for interconnections between shipping units.

## 2.6 ACCESSORY COMPONENTS AND FEATURES

- A. Accessory Set: Include tools and miscellaneous items required for overcurrent protective device test, inspection, maintenance, and operation.
- B. Spare-Fuse Cabinet: Suitably identified, wall-mounted, lockable, compartmented steel box or cabinet. Arrange for wall mounting.

## 2.7 IDENTIFICATION

- A. Service Equipment Label: NRTL labeled for use as service equipment for switchboards with one or more service disconnecting and overcurrent protective devices.

## **PART 3 - EXECUTION**

### **3.1 EXAMINATION**

- A. Receive, inspect, handle, and store switchboards according to NEMA PB 2.1.
- B. Examine switchboards before installation. Reject switchboards that are moisture damaged or physically damaged.
- C. Examine elements and surfaces to receive switchboards for compliance with installation tolerances and other conditions affecting performance of the Work.
- D. Proceed with installation only after unsatisfactory conditions have been corrected.

### **3.2 INSTALLATION**

- A. Install switchboards and accessories according to NEMA PB 2.1.
- B. Equipment Mounting: Install switchboards on concrete base, 4-inch nominal thickness. Comply with requirements for concrete base specified in Division 03.
  - 1. Install dowel rods to connect concrete base to concrete floor. Unless otherwise indicated, install dowel rods on 18-inch centers around the full perimeter of concrete base.
  - 2. For supported equipment, install epoxy-coated anchor bolts that extend through concrete base and anchor into structural concrete floor.
  - 3. Place and secure anchorage devices. Use setting drawings, templates, diagrams, instructions, and directions furnished with items to be embedded.
  - 4. Install anchor bolts to elevations required for proper attachment to switchboards.
- C. Temporary Lifting Provisions: Remove temporary lifting eyes, channels, and brackets and temporary blocking of moving parts from switchboard units and components.
- D. Operating Instructions: Frame and mount the printed basic operating instructions for switchboards, including control and key interlocking sequences and emergency procedures. Fabricate frame of finished wood or metal and cover instructions with clear acrylic plastic. Mount on front of switchboards.
- E. Install filler plates in unused spaces of panel-mounted sections.
- F. Install overcurrent protective devices, transient voltage suppression devices, and instrumentation.
  - 1. Set field-adjustable switches and circuit-breaker trip ranges.
- G. Install spare-fuse cabinet.
- H. Comply with NECA 1.

### **3.3 IDENTIFICATION**

- A. Identify field-installed conductors, interconnecting wiring, and components; provide warning signs complying with requirements for identification specified in Division 26.
- B. Switchboard Nameplates: Label each switchboard compartment with a nameplate complying with requirements for identification specified in Division 26.

- C. Device Nameplates: Label each disconnecting and overcurrent protective device and each meter and control device mounted in compartment doors with a nameplate complying with requirements for identification specified in Division 26.

### 3.4 FIELD QUALITY CONTROL

- A. Perform tests and inspections.
  - 1. Manufacturer's Field Service: Engage a factory-authorized service representative to inspect components, assemblies, and equipment installations, including connections, and to assist in testing.
- B. Acceptance Testing Preparation:
  - 1. Test insulation resistance for each switchboard bus, component, connecting supply, feeder, and control circuit.
  - 2. Test continuity of each circuit.
- C. Tests and Inspections:
  - 1. Perform each visual and mechanical inspection and electrical test stated in NETA Acceptance Testing Specification. Certify compliance with test parameters.
  - 2. Correct malfunctioning units on-site, where possible, and retest to demonstrate compliance; otherwise, replace with new units and retest.
  - 3. Perform the following infrared scan tests and inspections and prepare reports:
    - a. Initial Infrared Scanning: After Substantial Completion, but not more than 60 days after Final Acceptance, perform an infrared scan of each switchboard. Remove front panels so joints and connections are accessible to portable scanner.
    - b. Follow-up Infrared Scanning: Perform an additional follow-up infrared scan of each switchboard 11 months after date of Substantial Completion.
    - c. Instruments and Equipment:
      - 1) Use an infrared scanning device designed to measure temperature or to detect significant deviations from normal values. Provide calibration record for device.
  - 4. Test and adjust controls, remote monitoring, and safeties. Replace damaged and malfunctioning controls and equipment.
- D. Switchboard will be considered defective if it does not pass tests and inspections.
- E. Prepare test and inspection reports, including a certified report that identifies switchboards included and that describes scanning results. Include notation of deficiencies detected, remedial action taken, and observations after remedial action.

### 3.5 ADJUSTING

- A. Adjust moving parts and operable components to function smoothly, and lubricate as recommended by manufacturer.
- B. Set field-adjustable circuit-breaker trip ranges as specified in Division 26.

3.6 DEMONSTRATION

- A. Engage a factory-authorized service representative to train Owner's maintenance personnel to adjust, operate, and maintain switchboards, overcurrent protective devices, instrumentation, and accessories, and to use and reprogram microprocessor-based trip, monitoring, and communication units.

END OF SECTION

H:\Y0586.00\DOC\SPEC\2025\_02-20\_IFB\262413\_SWITCHBOARDS.DOC

## SECTION 262416 - PANELBOARDS

### PART 1 - GENERAL

#### 1.1 RELATED DOCUMENTS

- A. Certain requirements common to all the mechanical and electrical trades (Fire Suppression, Plumbing, HVAC, Electrical, and Tele/Data) are specified in Division 20. To avoid repetition, they are not repeated in each relevant Division and Section. However, these requirements are applicable to the work of this Section and are hereby incorporated by reference.
- B. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.

#### 1.2 SUMMARY

- A. Provide all labor, materials and equipment to furnish and install all of the items specified herein, indicated on the drawings and as necessary for the proper and complete performance of work.
- B. Panelboards shall be fully rated for available fault currents. Series ratings shall not be accepted.
- C. Emergency (NFPA 70 Article 700) and legally required (NFPA 70 Article 701), panelboards shall be equipped with devices such that selective coordination is maintained. The design intent in this specification and on the contract drawings has generally accounted for selective coordination. Illustrate the selectivity of proposed devices via the coordination study specified in Division 26.
- D. Section Includes:
  - 1. Distribution panelboards.
  - 2. Lighting and appliance branch-circuit panelboards.

#### 1.3 REFERENCES

- A. Publications listed below (including amendments, addenda, revisions, supplements, and errata) form part of this specification to the extent referenced. Publications are referenced in the text by the basic designations only.
  - 1. National Electrical Code (NEC)
  - 2. National Electrical Manufacturer's Association (NEMA).
    - a. PB-1 Panelboard
    - b. PB1.1 General Instructions for Proper Installation, Operation and Maintenance of Panelboards Rated 600 Volts or Less
  - 3. Underwriter's Laboratories (UL)
    - a. UL 50 Enclosures for Electrical Equipment
    - b. UL 67 Panelboards
    - c. UL 508 Standard for Safety Industrial Control Equipment
  - 4. American National Standard Institute (ANSI)

1.4 DEFINITIONS

- A. SVR: Suppressed voltage rating.
- B. TVSS: Transient voltage surge suppressor.

1.5 SUBMITTALS

- A. Panelboards shall be submitted subsequent to the fault current and coordination studies required in 260573. Equipment submittals prior to the required study shall not be reviewed by the Design Engineer and will be returned “rejected.”
- B. Panelboards shall be submitted in a logical fashion and follow the order scheduled on the drawings. Disorganized submittals shall not be reviewed by the Design Engineer and will be returned “rejected.”
- C. Product Data: For each type of panelboard, switching and overcurrent protective device, transient voltage suppression device, accessory, and component indicated. Include dimensions and manufacturers' technical data on features, performance, electrical characteristics, ratings, and finishes.
- D. Shop Drawings: For each panelboard and related equipment.
  - 1. Include dimensioned plans, elevations, sections, and details. Show tabulations of installed devices, equipment features, and ratings.
  - 2. Detail enclosure types and details for types other than NEMA 250, Type 1.
  - 3. Detail bus material, configuration, current, and voltage ratings.
  - 4. Short-circuit current rating of panelboards and overcurrent protective devices confirming fully rated equipment (series rating of circuit breakers is not acceptable).
  - 5. Detail features, characteristics, ratings, and factory settings of individual overcurrent protective devices and auxiliary components.
  - 6. Include wiring diagrams for power, signal, and control wiring.
  - 7. Include time-current coordination curves for each type and rating of overcurrent protective device included in panelboards. Submit selectable ranges for each type of overcurrent protective device.
- E. Field Quality-Control Reports:
  - 1. Test procedures used.
  - 2. Test results that comply with requirements.
  - 3. Results of failed tests and corrective action taken to achieve test results that comply with requirements.
- F. Panelboard Schedules: For installation in panelboards.
- G. Operation and Maintenance Data: For panelboards and components to include in emergency, operation, and maintenance manuals. In addition to items specified in Division 01, include the following:
  - 1. Manufacturer's written instructions for testing and adjusting overcurrent protective devices.

2. Time-current curves, including selectable ranges for each type of overcurrent protective device that allows adjustments.

#### 1.6 QUALITY ASSURANCE

- A. Source Limitations: Obtain panelboards, overcurrent protective devices, components, and accessories from single source from single manufacturer.
- B. Electrical Components, Devices, and Accessories: Listed and labeled as defined in NFPA 70, by a qualified testing agency, and marked for intended location and application.
- C. Comply with NEMA PB 1.
- D. Comply with NFPA 70.

#### 1.7 DELIVERY, STORAGE, AND HANDLING

- A. Deliver, store, protect, and handle products in conformance with manufacturer's recommended practices as outlined in applicable Installation and Maintenance Manuals.
- B. Inspect and report concealed damage to carrier within their required time period.
- C. Protect equipment throughout construction from damage, weather, excessive temperature, and construction operations.

#### 1.8 PROJECT CONDITIONS

- A. Environmental Limitations:
  1. Do not deliver or install panelboards until spaces are enclosed and weathertight, wet work in spaces is complete and dry, work above panelboards is complete, and temporary HVAC system is operating and maintaining ambient temperature and humidity conditions at occupancy levels during the remainder of the construction period.
  2. Rate equipment for continuous operation under the following conditions unless otherwise indicated:
    - a. Ambient Temperature: Not exceeding 23 deg F to plus 104 deg F.
    - b. Altitude: Not exceeding 6600 feet.
- B. Interruption of Existing Electric Service: Do not interrupt electric service to facilities occupied by Owner or others unless permitted under the following conditions and then only after arranging to provide temporary electric service according to requirements indicated:
  1. Notify Owner no fewer than 14 days in advance of proposed interruption of electric service.
  2. Do not proceed with interruption of electric service without Owner's written permission.
  3. Comply with NFPA 70E.

#### 1.9 COORDINATION

- A. Coordinate layout and installation of panelboards and components with other trades and construction that penetrates walls or is supported by them, including electrical and other types of equipment, raceways, piping, encumbrances to dedicated equipment space and workspace

clearance requirements, and adjacent surfaces. Maintain required workspace clearances and required clearances for equipment access doors and panels.

**1.10 WARRANTY**

- A. Special Warranty: Manufacturer's standard form in which manufacturer agrees to repair or replace transient voltage suppression devices that fail in materials or workmanship within specified warranty period.
  - 1. Warranty Period: One year from date of Substantial Completion.

**1.11 EXTRA MATERIALS**

- A. Furnish extra materials that match products installed and that are packaged with protective covering for storage and identified with labels describing contents.
  - 1. Keys: Two spares for each type of panelboard cabinet lock.
  - 2. Circuit Breakers Including GFCI and Ground Fault Equipment Protection (GFEP) Types: Two spares for each panelboard.

**PART 2 - PRODUCTS**

**2.1 GENERAL REQUIREMENTS FOR PANELBOARDS**

- A. Manufacturers
  - 1. The design is based on Square D to establish standards of quality for materials and performance. The naming of a specific manufacturer or catalog number does not waive any requirements or performance of individual components described in the specification. Provide Square D Series NQOB and NF for 225A and below for receptacle and lighting panels and I-Line for distribution and panels above 225A.
  - 2. Eaton Cutler-Hammer panelboards shall be Type PRL-1 for 225A and below for receptacle and lighting panels, Cutler-Hammer PRL-3 for distribution to 225A and Cutler-Hammer PRL-4 for distribution to 1200A.
  - 3. ABB-General Electric panelboards shall be Series A for 225A and below for receptacle and lighting panels, ABB-General Electric Spectra Series for panelboards and distribution panels above 225A.
  - 4. Siemens panelboards Type P1, P2 or P3 for 225A and below for receptacle and lighting panels, Type P4 and P5 for panelboards and distribution panels above 225A.
  - 5. Or approved equal.
- B. Fabricate and test panelboards according to IEEE 344 to withstand seismic forces defined in Division 26.
- C. Enclosures: Flush- and surface-mounted cabinets as indicated in the contract documents.
  - 1. Rated for environmental conditions at installed location.
    - a. Indoor Dry and Clean Locations: NEMA 250, Type 1.
    - b. Outdoor Locations: NEMA 250, Type 3R.

- c. Other Wet or Damp Indoor Locations: NEMA 250, Type 4.
- 2. Hinged Front Cover: Entire front trim hinged to box and with standard door within hinged trim cover (door in door type). Opening inner door shall expose circuit breaker operator handles and panelboard directory. Opening outer door shall expose terminals and circuit breakers in a single operation.
- 3. Where two section panels are required, bolt boxes together to form one unit. Trim shall be two-piece construction with doors of equal size over each section.
- 4. Power and lighting panels shall have heavy duty, continuous, section vertical-hinging to box section for access to wiring gutters in addition to trim door
- 5. Finishes:
  - a. Panels and Trim: Steel, factory finished immediately after cleaning and pretreating with manufacturer's standard two-coat, baked-on finish consisting of prime coat and thermosetting topcoat.
  - b. Back Boxes: Galvanized steel.
- 6. Directory Card: Inside panelboard door, mounted in metal frame with transparent protective cover. Directories shall be typed showing use of each circuit and the panelboard designation.
- 7. Panelboard designations shall be labeled on the front of the panel with a screw-on nameplate.
- D. Phase, Neutral, and Ground Buses:
  - 1. Material: Tin-plated aluminum.
  - 2. Equipment Ground Bus: Adequate for feeder and branch-circuit equipment grounding conductors; bonded to box.
- E. Conductor Connectors: Suitable for use with conductor material and sizes.
  - 1. Material: Tin-plated aluminum.
  - 2. Main and Neutral Lugs: Mechanical type.
  - 3. Ground Lugs and Bus-Configured Terminators: Mechanical type.
  - 4. Feed-Through Lugs: Mechanical type, suitable for use with conductor material. Locate at opposite end of bus from incoming lugs or main device.
  - 5. Subfeed (Double) Lugs: Mechanical type suitable for use with conductor material. Locate at same end of bus as incoming lugs or main device.
- F. Future Devices: Mounting brackets, bus connections, filler plates, and necessary appurtenances required for future installation of devices.
- G. Panelboard Short-Circuit Current Rating: Fully rated to interrupt symmetrical short-circuit current available at terminals.

## 2.2 PANELBOARDS

- A. Panelboards shall meet or exceed requirements of NEMA Standard Publication PB-1 and UL-50 and 67. Provide cabinets with flush hinges and combination catch and lock. Provide wiring gutters to accommodate large multiplier feeder cables and lugs. Except as shown otherwise on

drawings, wiring gutters shall be at least 4" for lighting and 208V panels and 6" for 480V panels.

- B. Increase size of panelboard gutters to accommodate compression connectors for aluminum conductors.
- C. Panelboards shall have short circuit current rating equal to or greater than circuit breaker AIC ratings schedule on drawings.
- D. Panelboards served from transformers shall have a main breaker, unless an enclosed circuit breaker or fused switch is shown.
- E. Main bus bars shall be silver plated aluminum, sized as required by UL standards to limit temperature rise on current carrying parts to 50°C above ambient 40°C maximum. Main bus bars shall be sized at least to full rating of feeders overcurrent device that feeds the panelboard.
- F. Provide molded case, bolt-on, thermal-magnetic trip, single, two or three pole branch circuit breakers as shown on drawings. Multiple pole breakers shall be single handle, common-trip. Circuit breakers shall be listed and labeled for 75°C conductor ampacities.
- G. Provide bus connections for future overcurrent device with suitable insulation and bracing to maintain proper short circuit rating and voltage clearances, where required on drawings. Provide for ready insertion of future breaker.
- H. Provide separate equipment ground bus for each panelboard.
- I. Where shown on drawings, provide isolated ground bus in addition to the equipment ground bus. The isolated ground bus shall be insulated from panel enclosure and shall be copper.
- J. Conductor Connectors: Suitable for use with conductor material and sizes.
  - 1. Main and Neutral Lugs: Mechanical type.
  - 2. Ground Lugs and Bus-Configured Terminators: Mechanical type.
  - 3. Feed-Through Lugs: Mechanical type, suitable for use with conductor material. Locate at opposite end of bus from incoming lugs or main device.
  - 4. Subfeed (Double) Lugs: Mechanical type suitable for use with conductor material. Locate at same end of bus as incoming lugs or main device.
- K. Future Devices: Mounting brackets, bus connections, filler plates, and necessary appurtenances required for future installation of devices.

### 2.3 DISCONNECTING AND OVERCURRENT PROTECTIVE DEVICES

- A. Molded-Case Circuit Breaker (MCCB): Comply with UL 489, with interrupting capacity to meet available fault currents.
  - 1. Thermal-Magnetic Circuit Breakers: Inverse time-current element for low-level overloads, and instantaneous magnetic trip element for short circuits. Adjustable magnetic trip setting for circuit-breaker frame sizes 250 A and larger.
  - 2. Adjustable Instantaneous-Trip Circuit Breakers: Magnetic trip element with front-mounted, field-adjustable trip setting.
  - 3. Electronic trip circuit breakers with RMS sensing; field-replaceable rating plug or field-replaceable electronic trip; and the following field-adjustable settings:
    - a. Instantaneous trip.

- b. Long- and short-time pickup levels.
  - c. Long- and short-time time adjustments.
  - d. Ground-fault pickup level, time delay, and  $I^2t$  response.
- 4. GFCI Circuit Breakers: Single- and two-pole configurations with Class A ground-fault protection (6-mA trip).
- 5. Ground-Fault Equipment Protection (GFEP) Circuit Breakers: Class B ground-fault protection (30-mA trip).
- 6. Arc-Fault Circuit Interrupter (AFCI) Circuit Breakers: Comply with UL 1699; 120/240-V, single-pole configuration.
- 7. Molded-Case Circuit-Breaker (MCCB) Features and Accessories:
  - a. Standard frame sizes, trip ratings, and number of poles.
  - b. Lugs: Mechanical style, suitable for number, size, trip ratings, and conductor materials.
  - c. Application Listing: Appropriate for application; Type SWD for switching fluorescent lighting loads; Type HID for feeding fluorescent and high-intensity discharge (HID) lighting circuits.
  - d. Ground-Fault Protection: Integrally mounted relay and trip unit with adjustable pickup and time-delay settings, push-to-test feature, and ground-fault indicator.
  - e. Multipole units enclosed in a single housing or factory assembled to operate as a single unit.
  - f. Handle Padlocking Device: Fixed attachment, for locking circuit-breaker handle in on or off position.
  - g. Handle Clamp: Loose attachment, for holding circuit-breaker handle in on position.

## 2.4 PANELBOARD SURGE PROTECTION DEVICES

- A. Surge Protection Device: Provide factory installed IEEE C62.41-compliant, integrally mounted, solid-state, parallel-connected, non-modular type, with sine-wave tracking suppression and filtering modules, UL 1449, second edition, short-circuit current rating matching or exceeding the panelboard short-circuit rating, in accordance with Division 26.

## 2.5 ACCESSORY COMPONENTS AND FEATURES

- A. Accessory Set: Include tools and miscellaneous items required for overcurrent protective device test, inspection, maintenance, and operation.

# PART 3 - EXECUTION

## 3.1 EXAMINATION

- A. Receive, inspect, handle, and store panelboards according to NEMA PB 1.1.

- B. Examine panelboards at delivery before installation. Reject panelboards that are damaged or rusted or have been subjected to water saturation.
- C. Examine the areas and conditions under which panelboards are to be installed and notify engineer in writing of conditions detrimental to the proper and timely completion of work.
- D. Proceed with installation only after unsatisfactory conditions have been corrected.

### 3.2 INSTALLATION

- A. Install panelboards where indicated, in accordance with manufacturer's written instructions, guidelines and the applicable requirements of the NEC, local codes, the National Electrical Contractors Association's "Standard of Installation" and in accordance with recognized industry practices to ensure that products serve the intended function.
- B. Install all flush mounted panelboards with one spare 1½ -inch and two ¾" conduits from panel to above accessible ceiling.
- C. Location:
  - 1. Maintain the minimum NEC clearances about the equipment.
  - 2. Locate top of enclosures approximately 6'-6" above floor, at a masonry joint if applicable. Panelboard shall never be mounted such that the handle of the highest circuit breaker exceeds 6'-6" AFF.
  - 3. Provide 1/2" spacers for panelboards mounted at exterior walls below grade to establish an air space behind panel.
- D. Anchoring:
  - 1. Provide all necessary hardware to secure panelboard in place. Anchor enclosure firmly to walls and structural surfaces, ensuring that they are permanently and mechanically secure.
  - 2. Mount free standing distribution panels on 6-inch high concrete pads with 1-inch chamfered edges.
  - 3. Comply with mounting and anchoring requirements specified in Division 26.
- E. Branch circuit wiring shall be peeled out of the wiring gutters at 90 degrees to circuit breakers and terminal lugs for a neat installation.
- F. Install overcurrent protective devices and controllers not already factory installed.
- G. Set field-adjustable, circuit-breaker trip ranges.
- H. Install filler plates in unused spaces.
- I. Arrange conductors in gutters into groups and bundle and wrap with wire ties.

### 3.3 IDENTIFICATION

- A. Identify field-installed conductors, interconnecting wiring, and components; provide warning signs complying with Division 26.
- B. Directories:
  - 1. Fill out the enclosure circuit directory card upon completion of work and install in panelboard.

2. Use a computer or typewriter to create directory; handwritten directories are not acceptable.
  3. Incorporate Owner's final room designations. Obtain approval before installing.
- C. Panelboard Nameplates: Label each panelboard with a nameplate complying with requirements for identification specified in Division 26.
- D. Device Nameplates: Label each branch circuit device in distribution panelboards with a nameplate complying with requirements for identification specified in Division 26.

### 3.4 FIELD QUALITY CONTROL

- A. Perform tests and inspections.
- B. Acceptance Testing Preparation:
1. Test insulation resistance for each panelboard bus, component, connecting supply, feeder, and control circuit.
  2. Test continuity of each circuit.
- C. Tests and Inspections:
1. Perform each visual and mechanical inspection and electrical test stated in NETA Acceptance Testing Specification. Certify compliance with test parameters.
  2. Correct malfunctioning units on-site, where possible, and retest to demonstrate compliance; otherwise, replace with new units and retest.
  3. Perform the following infrared scan tests and inspections and prepare reports:
    - a. Initial Infrared Scanning: After Substantial Completion, but not more than 60 days after Final Acceptance, perform an infrared scan of each panelboard. Remove front panels so joints and connections are accessible to portable scanner.
    - b. Follow-up Infrared Scanning: Perform an additional follow-up infrared scan of each panelboard 11 months after date of Substantial Completion.
    - c. Instruments and Equipment:
      - 1) Use an infrared scanning device designed to measure temperature or to detect significant deviations from normal values. Provide calibration record for device.
- D. Panelboards will be considered defective if they do not pass tests and inspections.
- E. Prepare test and inspection reports, including a certified report that identifies panelboards included and that describes scanning results. Include notation of deficiencies detected, remedial action taken, and observations after remedial action.

### 3.5 ADJUSTING

- A. Adjust moving parts and operable component to function smoothly, and lubricate as recommended by manufacturer.
- B. Set field-adjustable circuit-breaker trip ranges as specified in Division 26

3.6 PROTECTION

- A. Temporary Heating: Apply temporary heat to maintain temperature according to manufacturer's written instructions.

END OF SECTION

H:\Y0586.00\DOC\SPEC\2025\_02-20\_IFB\262416\_PANELBOARDS.DOC

## **SECTION 262726 - WIRING DEVICES**

### **PART 1 - GENERAL**

#### **1.1 RELATED DOCUMENTS**

- A. Certain requirements common to all the mechanical and electrical trades (Fire Suppression, Plumbing, HVAC, Electrical, and Tele/Data) are specified in Division 20. To avoid repetition, they are not repeated in each relevant Division and Section. However, these requirements are applicable to the work of this Section and are hereby incorporated by reference.
- B. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.

#### **1.2 SUMMARY**

- A. This Section includes the following:
  - 1. Straight blade receptacles
  - 2. GFCI receptacles
  - 3. Twist-locking receptacles
  - 4. Wall plates
  - 5. Floor service fittings
  - 6. Poke-through assemblies
  - 7. Multi-outlet assemblies
  - 8. Finishes
- B. Related Sections include the following:
  - 1. Division 27 Section "Communications Horizontal Cabling" for workstation outlets.

#### **1.3 DEFINITIONS**

- A. EMI: Electromagnetic interference.
- B. GFCI: Ground-fault circuit interrupter.
- C. Pigtail: Short lead used to connect a device to a branch-circuit conductor.
- D. RFI: Radio-frequency interference.
- E. TVSS: Transient voltage surge suppressor.
- F. UTP: Unshielded twisted pair.

#### **1.4 SUBMITTALS**

- A. Product Data: For each type of product indicated.
- B. Shop Drawings: List of legends and description of materials and process used for premarking wall plates.

- C. Samples: One for each type of device and wall plate specified, in each color specified.
- D. Field quality-control test reports.
- E. Operation and Maintenance Data: For wiring devices to include in all manufacturers' packing label warnings and instruction manuals that include labeling conditions.

## 1.5 QUALITY ASSURANCE

- A. Source Limitations: Obtain each type of wiring device and associated wall plate through one source from a single manufacturer. Insofar as they are available, obtain all wiring devices and associated wall plates from a single manufacturer and one source.
- B. Electrical Components, Devices, and Accessories: Listed and labeled as defined in NFPA 70, Article 100, by a testing agency acceptable to authorities having jurisdiction, and marked for intended use.
- C. Comply with NFPA 70.

## 1.6 COORDINATION

- A. Receptacles for Owner-Furnished Equipment: Match plug configurations.
  - 1. Cord and Plug Sets: Match equipment requirements.
- B. Coordinate the locations of outlet boxes between the electrical drawings and any other drawings associated with the project. Discrepancies shall be brought to the attention of the Architect by formal RFI procedure. Any reasonable change in location of outlets shall not involve additional expense to Owner. The term "reasonable" shall be interpreted as moving outlet 10'-0" in any direction from the location indicated on the Electrical drawings. Refer to specifications 20 00 00 for additional information regarding discrepancies in documents.

## 1.7 EXTRA MATERIALS

- A. Furnish extra materials described in subparagraphs below that match products installed and that are packaged with protective covering for storage and identified with labels describing contents.
  - 1. Floor Service Outlet Assemblies: One for every 10, but no fewer than one.
  - 2. Poke-Through, Fire-Rated Closure Plugs: One for every five floor service outlets installed, but no fewer than two.

## PART 2 - PRODUCTS

### 2.1 MANUFACTURERS

- A. Manufacturers' Names: Shortened versions (shown in parentheses) of the following manufacturers' names are used in other Part 2 articles:
  - 1. Cooper Wiring Devices; a division of Cooper Industries, Inc. (Cooper).
  - 2. Hubbell Incorporated; Wiring Device-Kellems (Hubbell).
  - 3. Leviton Mfg. Company Inc. (Leviton).
  - 4. Pass & Seymour/Legrand; Wiring Devices & Accessories (Pass & Seymour).

5. Or approved equal

## 2.2 STRAIGHT BLADE RECEPTACLES

- A. Convenience Receptacles, 125 V, 20 A: Comply with NEMA WD 1, NEMA WD 6 configuration 5-20R, and UL 498.
  1. Products: Subject to compliance with requirements, provide one of the following:
    - a. Cooper; 5351 (single), 5352 (duplex).
    - b. Hubbell; HBL5351 (single), CR5352 (duplex).
    - c. Leviton; 5891 (single), 5352 (duplex).
    - d. Pass & Seymour; 5361 (single), CRB5362 (duplex).
    - e. Or approved equal

## 2.3 GFCI RECEPTACLES

- A. General Description: Straight blade, non-feed-through type. Comply with NEMA WD 1, NEMA WD 6, UL 498, and UL 943, Class A, Federal Specification W-C-596 and include indicator light that is lighted when device is tripped. The device must have Self-test feature (conducts an automatic test, ensuring ground fault protection). If ground fault protection is compromised, power to the receptacle must be discontinued.
- B. Duplex GFCI Convenience Receptacles, 125 V, 20 A:
  1. Products: Subject to compliance with requirements, provide one of the following:
    - a. Cooper; GF20.
    - b. Hubbell;
    - c. Leviton;
    - d. Pass & Seymour; 2097.
    - e. Or approved equal

## 2.4 TWIST-LOCKING RECEPTACLES

- A. Single Convenience Receptacles, 125 V, 20 A: Comply with NEMA WD 1, NEMA WD 6 configuration L5-20R, and UL 498.
  1. Products: Subject to compliance with requirements, provide one of the following:
    - a. Cooper; L520R.
    - b. Hubbell; HBL2310.
    - c. Leviton; 2310.
    - d. Pass & Seymour; L520-R.
    - e. Or approved equal

## 2.5 WALL PLATES

- A. Single and combination types to match corresponding wiring devices.
  - 1. Plate-Securing Screws: Metal with head color to match plate finish.
  - 2. Material for Finished Spaces: 0.035-inch- thick, satin-finished stainless steel.
  - 3. Material for Unfinished Spaces: Galvanized steel.
  - 4. Material for Damp Locations: Thermoplastic with spring-loaded lift cover, and listed and labeled for use in "wet locations."
- B. Wet-Location, Weatherproof Cover Plates: NEMA 250, complying with type 3R weather-resistant, die-cast aluminum with lockable cover.

## 2.6 FLOOR SERVICE FITTINGS

- A. Type: Modular, flush-type, dual-service units suitable for wiring method used.
- B. Compartments: Barrier separates power from voice and data communication cabling.
- C. Service Plate: Rectangular, with satin finish.
- D. Power Receptacle: NEMA WD 6 configuration 5-20R, gray finish, unless otherwise indicated.

## 2.7 POKE-THROUGH ASSEMBLIES

- A. Manufacturers: Subject to compliance with requirements, provide products by one of the following:
  - 1. Hubbell Incorporated; Wiring Device-Kellems.
  - 2. Pass & Seymour/Legrand; Wiring Devices & Accessories.
  - 3. Square D/ Schneider Electric.
  - 4. Thomas & Betts Corporation.
  - 5. Wiremold Company (The).
  - 6. Or approved equal
- B. Description: Factory-fabricated and -wired assembly of below-floor junction box with multichanneled, through-floor raceway/firestop unit and detachable matching floor service outlet assembly.
  - 1. Service Outlet Assembly: Flush type with two simplex receptacles and space for two RJ-45 jacks.
  - 2. Size: Selected to fit nominal 4-inch cored holes in floor and matched to floor thickness.
  - 3. Fire Rating: Unit is listed and labeled for fire rating of floor-ceiling assembly.
  - 4. Closure Plug: Arranged to close unused 4-inch cored openings and reestablish fire rating of floor.
  - 5. Wiring Raceways and Compartments: For a minimum of four No. 12 AWG conductors and a minimum of two, 4-pair, Category 5e voice and data communication cables.

## 2.8 MULTIOUTLET ASSEMBLIES

- A. Manufacturers: Subject to compliance with requirements, provide products by one of the following:
  - 1. Hubbell Incorporated; Wiring Device-Kellems.
  - 2. Mono Systems
  - 3. Wiremold Company (The).
  - 4. Or approved equal
- B. Components of Assemblies: Products from a single manufacturer designed for use as a complete, matching assembly of raceways and receptacles.
- C. Raceway Material: Metal, with manufacturer's standard finish.
- D. Wire: No. 12 AWG.

## 2.9 FINISHES

- A. Color: Wiring device catalog numbers in Section Text do not designate device color.
  - 1. Wiring Devices Connected to Normal Power System: White, unless otherwise indicated or required by NFPA 70, device listing.
  - 2. Wiring Devices Connected to Emergency Power System: Red.

# PART 3 - EXECUTION

## 3.1 INSTALLATION

- A. Comply with NECA 1, including the mounting heights listed in that standard, unless otherwise noted.
- B. Coordination with Other Trades:
  - 1. Take steps to insure that devices and their boxes are protected. Do not place wall finish materials over device boxes and do not cut holes for boxes with routers that are guided by riding against outside of the boxes.
  - 2. Keep outlet boxes free of plaster, drywall joint compound, mortar, cement, concrete, dust, paint, and other material that may contaminate the raceway system, conductors, and cables.
  - 3. Install device boxes in brick or block walls so that the cover plate does not cross a joint unless the joint is troweled flush with the face of the wall.
  - 4. Install wiring devices after all wall preparation, including painting, is complete.
- C. Conductors:
  - 1. Do not strip insulation from conductors until just before they are spliced or terminated on devices.
  - 2. Strip insulation evenly around the conductor using tools designed for the purpose. Avoid scoring or nicking of solid wire or cutting strands from stranded wire.

3. The length of free conductors at outlets for devices shall meet provisions of NFPA 70, Article 300, without pigtails.
4. Existing Conductors:
  - a. Cut back and pigtail, or replace all damaged conductors.
  - b. Straighten conductors that remain and remove corrosion and foreign matter.
  - c. Pigtail existing conductors is permitted provided the outlet box is large enough.

**D. Device Installation:**

1. Replace all devices that have been in temporary use during construction or that show signs that they were installed before building finishing operations were complete.
2. Keep each wiring device in its package or otherwise protected until it is time to connect conductors.
3. Do not remove surface protection, such as plastic film and smudge covers, until the last possible moment.
4. Connect devices to branch circuits using pigtails that are not less than 6 inches in length.
5. When there is a choice, use side wiring with binding-head screw terminals. Wrap solid conductor tightly clockwise, 2/3 to 3/4 of the way around terminal screw.
6. Use a torque screwdriver when a torque is recommended or required by the manufacturer.
7. When conductors larger than No. 12 AWG are installed on 15- or 20-A circuits, splice No. 12 AWG pigtails for device connections.
8. Tighten unused terminal screws on the device.
9. When mounting into metal boxes, remove the fiber or plastic washers used to hold device mounting screws in yokes, allowing metal-to-metal contact.

**E. Receptacle Orientation:**

1. Install ground pin of vertically mounted receptacles up, and on horizontally mounted receptacles to the right.

**F. Device Plates:** Do not use oversized or extra-deep plates. Repair wall finishes and remount outlet boxes when standard device plates do not fit flush or do not cover rough wall opening.

**G. Arrangement of Devices:** Unless otherwise indicated, mount flush, with long dimension vertical and with grounding terminal of receptacles on top. Group adjacent switches under single, multigang wall plates.

**H. Adjust locations of floor service outlets and service poles to suit arrangement of partitions and furnishings.**

**3.2 IDENTIFICATION**

**A. Comply with Division 26 Section "Identification for Electrical Systems."**

1. Receptacles: Identify panelboard and circuit number from which served. Use hot, stamped or engraved machine printing with black-filled lettering on face of plate, and durable wire markers or tags inside outlet boxes.

### 3.3 FIELD QUALITY CONTROL

- A. Perform tests and inspections and prepare test reports.
  - 1. In healthcare facilities, prepare reports that comply with recommendations in NFPA 99.
  - 2. Test Instruments: Use instruments that comply with UL 1436.
  - 3. Test Instrument for Convenience Receptacles: Digital wiring analyzer with digital readout or illuminated LED indicators of measurement.
- B. Tests for Convenience Receptacles:
  - 1. Line Voltage: Acceptable range is 105 to 132 V.
  - 2. Percent Voltage Drop under 15-A Load: A value of 6 percent or higher is not acceptable.
  - 3. Ground Impedance: Values of up to 2 ohms are acceptable.
  - 4. GFCI Trip: Test for tripping values specified in UL 1436 and UL 943.
  - 5. Using the test plug, verify that the device and its outlet box are securely mounted.
  - 6. The tests shall be diagnostic, indicating damaged conductors, high resistance at the circuit breaker, poor connections, inadequate fault current path, defective devices, or similar problems. Correct circuit conditions, remove malfunctioning units and replace with new ones, and retest as specified above.

END OF SECTION

H:\Y0586.00\DOC\SPEC\2025\_02-20\_IFB\262726\_WIRING DEVICES.DOC

## SECTION 262813 - FUSES

### PART 1 - GENERAL

#### 1.1 RELATED DOCUMENTS

- A. Certain requirements common to all the mechanical and electrical trades (Fire Suppression, Plumbing, HVAC, Electrical, and Tele/Data) are specified in Division 20. To avoid repetition, they are not repeated in each relevant Division and Section. However, these requirements are applicable to the work of this Section and are hereby incorporated by reference.
- B. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.

#### 1.2 SUMMARY

- A. Section Includes:
  - 1. Cartridge fuses rated 600-V ac and less for use in enclosed switches, switchboards, and enclosed controllers.
  - 2. Spare-fuse cabinets.

#### 1.3 REFERENCES

- A. Publications listed below (including amendments, addenda, revisions, supplements, and errata) form part of this specification to the extent referenced. Publications are referenced in the text by the basic designations only.
  - 1. National Electrical Code (NEC)
  - 2. Underwriter's Laboratories (UL)
    - a. UL 50 Enclosures for Electrical Equipment
    - b. UL 508 Standard for Safety Industrial Control Equipment
    - c. UL 977 Fused Power Circuit Devices
  - 3. American National Standard Institute (ANSI)

#### 1.4 SUBMITTALS

- A. Product Data: For each type and rating of product indicated. Include construction details, material, dimensions, descriptions of individual components, and finishes for spare-fuse cabinets. Include the following for each fuse type indicated:
  - 1. Ambient Temperature Adjustment Information: If ratings of fuses have been adjusted to accommodate ambient temperatures, provide list of fuses with adjusted ratings.
    - a. For each fuse having adjusted ratings, include location of fuse, original fuse rating, local ambient temperature, and adjusted fuse rating.
    - b. Provide manufacturer's technical data on which ambient temperature adjustment calculations are based.

2. Dimensions and manufacturer's technical data on features, performance, electrical characteristics, and ratings.
  3. Current-limitation curves for fuses with current-limiting characteristics.
  4. Time-current coordination curves (average melt) and current-limitation curves (instantaneous peak let-through current) for each type and rating of fuse.
  5. Coordination charts and tables and related data.
  6. Fuse sizes for elevator feeders and elevator disconnect switches.
- B. Operation and Maintenance Data: For fuses to include in emergency, operation, and maintenance manuals. In addition to items specified in Division 01, include the following:
1. Ambient temperature adjustment information.
  2. Current-limitation curves for fuses with current-limiting characteristics.
  3. Time-current coordination curves (average melt) and current-limitation curves (instantaneous peak let-through current) for each type and rating of fuse.
  4. Coordination charts and tables and related data.

#### 1.5 QUALITY ASSURANCE

- A. Source Limitations: Obtain fuses, for use within a specific product or circuit, from single source from single manufacturer.
- B. Electrical Components, Devices, and Accessories: Listed and labeled as defined in NFPA 70, by a qualified testing agency, and marked for intended location and application.
- C. Comply with NEMA FU 1 for cartridge fuses.
- D. Comply with NFPA 70.

#### 1.6 PROJECT CONDITIONS

- A. Where ambient temperature to which fuses are directly exposed is less than 40 deg F or more than 100 deg F, apply manufacturer's ambient temperature adjustment factors to fuse ratings.

#### 1.7 COORDINATION

- A. Coordinate fuse ratings with utilization equipment nameplate limitations of maximum fuse size and with system short-circuit current levels.

#### 1.8 EXTRA MATERIALS

- A. Furnish extra materials that match products installed and that are packaged with protective covering for storage and identified with labels describing contents.
  1. Fuses: Equal to 10 percent of quantity installed for each size and type, but no fewer than two of each size and type.

## PART 2 - PRODUCTS

### 2.1 MANUFACTURERS

- A. Manufacturers: Subject to compliance with requirements, provide products by one of the following :
  - 1. Cooper Bussmann, Inc.
  - 2. Edison Fuse, Inc.
  - 3. Ferraz Shawmut, Inc.
  - 4. Littelfuse, Inc.
  - 5. Or approved equal.

### 2.2 CARTRIDGE FUSES

- A. Characteristics: NEMA FU 1, nonrenewable cartridge fuses with voltage ratings consistent with circuit voltages.

### 2.3 SPARE-FUSE CABINET

- A. Characteristics: Wall-mounted steel unit with full-length, recessed piano-hinged door and key-coded cam lock and pull.
  - 1. Size: Adequate for storage of spare fuses specified with 15 percent spare capacity minimum.
  - 2. Finish: Gray, baked enamel.
  - 3. Identification: "SPARE FUSES" in 1-1/2-inch- high letters on exterior of door.
  - 4. Fuse Pullers: For each size of fuse, where applicable and available, from fuse manufacturer.

## PART 3 - EXECUTION

### 3.1 EXAMINATION

- A. Examine fuses before installation. Reject fuses that are moisture damaged or physically damaged.
- B. Examine holders to receive fuses for compliance with installation tolerances and other conditions affecting performance, such as rejection features.
- C. Examine utilization equipment nameplates and installation instructions. Install fuses of sizes and with characteristics appropriate for each piece of equipment.
- D. Evaluate ambient temperatures to determine if fuse rating adjustment factors must be applied to fuse ratings.
- E. Proceed with installation only after unsatisfactory conditions have been corrected.

### 3.2 FUSE APPLICATIONS

- A. Cartridge Fuses:
  - 1. Service Entrance: Class L, time delay.
  - 2. Feeders: Class L, time delay.
  - 3. Motor Branch Circuits: Class RK1, time delay.
  - 4. Elevator Branch Circuits: Class J, time delay.
  - 5. Other Branch Circuits: Class RK1, time delay.
  - 6. Control Circuits: Class CC, fast acting.

### 3.3 INSTALLATION

- A. Install fuses in fusible devices. Arrange fuses so rating information is readable without removing fuse.
- B. Install spare-fuse cabinet(s).

### 3.4 IDENTIFICATION

- A. Install labels complying with requirements for identification specified in Division 26 and indicating fuse replacement information on inside door of each fused switch and adjacent to each fuse block, socket, and holder.

END OF SECTION

## SECTION 262816 - ENCLOSED SWITCHES AND CIRCUIT BREAKERS

### PART 1 - GENERAL

#### 1.1 RELATED DOCUMENTS

- A. Certain requirements common to all the mechanical and electrical trades (Fire Suppression, Plumbing, HVAC, Electrical, and Tele/Data) are specified in Division 20. To avoid repetition, they are not repeated in each relevant Division and Section. However, these requirements are applicable to the work of this Section and are hereby incorporated by reference.
- B. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.

#### 1.2 SUMMARY

- A. Section Includes:
  - 1. Fusible switches.
  - 2. Molded-case circuit breakers (MCCBs).
  - 3. Molded-case switches.
  - 4. Enclosures.

#### 1.3 DEFINITIONS

- A. NC: Normally closed.
- B. NO: Normally open.
- C. SPDT: Single pole, double throw.

#### 1.4 SUBMITTALS

- A. Product Data: For each type of enclosed switch, circuit breaker, accessory, and component indicated. Include dimensioned elevations, sections, weights, and manufacturers' technical data on features, performance, electrical characteristics, ratings, accessories, and finishes.
  - 1. Enclosure types and details for types other than NEMA 250, Type 1.
  - 2. Current and voltage ratings.
  - 3. Short-circuit current ratings (interrupting and withstand, as appropriate).
  - 4. Detail features, characteristics, ratings, and factory settings of individual overcurrent protective devices, accessories, and auxiliary components.
  - 5. Include time-current coordination curves (average melt) for each type and rating of overcurrent protective device; include selectable ranges for each type of overcurrent protective device.
- B. Shop Drawings: For enclosed switches and circuit breakers. Include plans, elevations, sections, details, and attachments to other work.

1. Wiring Diagrams: For power, signal, and control wiring.
- C. Field quality-control reports.
  1. Test procedures used.
  2. Test results that comply with requirements.
  3. Results of failed tests and corrective action taken to achieve test results that comply with requirements.
- D. Operation and Maintenance Data: For enclosed switches and circuit breakers to include in emergency, operation, and maintenance manuals. In addition to items specified in Division 01, include the following:
  1. Manufacturer's written instructions for testing and adjusting enclosed switches and circuit breakers.
  2. Time-current coordination curves (average melt) for each type and rating of overcurrent protective device; include selectable ranges for each type of overcurrent protective device.

#### 1.5 QUALITY ASSURANCE

- A. Source Limitations: Obtain enclosed switches and circuit breakers, overcurrent protective devices, components, and accessories, within same product category, from single source from single manufacturer.
- B. Electrical Components, Devices, and Accessories: Listed and labeled as defined in NFPA 70, by a qualified testing agency, and marked for intended location and application.
- C. Comply with NFPA 70.

#### 1.6 PROJECT CONDITIONS

- A. Environmental Limitations: Rate equipment for continuous operation under the following conditions unless otherwise indicated:
  1. Ambient Temperature: Not less than minus 22 deg F and not exceeding 104 deg F.
  2. Altitude: Not exceeding 6600 feet.
- B. Interruption of Existing Electric Service: Do not interrupt electric service to facilities occupied by Owner or others unless permitted under the following conditions and then only after arranging to provide temporary electric service according to requirements indicated:
  1. Notify Owner no fewer than 14 days in advance of proposed interruption of electric service.
  2. Indicate method of providing temporary electric service.
  3. Do not proceed with interruption of electric service without Owner's written permission.
  4. Comply with NFPA 70E.

1.7 COORDINATION

- A. Coordinate layout and installation of switches, circuit breakers, and components with equipment served and adjacent surfaces. Maintain required workspace clearances and required clearances for equipment access doors and panels.

1.8 EXTRA MATERIALS

- A. Furnish extra materials that match products installed and that are packaged with protective covering for storage and identified with labels describing contents.
  - 1. Fuses: Equal to 10 percent of quantity installed for each size and type, but no fewer than three of each size and type.
  - 2. Fuse Pullers: Two for each size and type.
  - 3. .

PART 2 - PRODUCTS

2.1 FUSIBLE SWITCHES

- A. Manufacturers: Subject to compliance with requirements, provide products by one of the following:
  - 1. Eaton Electrical Inc.; Cutler-Hammer Business Unit.
  - 2. ABB-General Electric; GE Consumer & Industrial - Electrical Distribution.
  - 3. Siemens Energy & Automation, Inc.
  - 4. Square D; a brand of Schneider Electric.
  - 5. Or approved equal.
- B. Type GD, General Duty, Single Throw, 240-V ac, 800 A and Smaller: UL 98 and NEMA KS 1, horsepower rated, with cartridge fuse interiors to accommodate specified fuses, lockable handle with capability to accept two padlocks, and interlocked with cover in closed position.
- C. Type HD, Heavy Duty, Single Throw, 600-V ac, 1200 A and Smaller: UL 98 and NEMA KS 1, horsepower rated, with clips or bolt pads to accommodate specified fuses, lockable handle with capability to accept three padlocks, and interlocked with cover in closed position.
- D. Accessories:
  - 1. Equipment Ground Kit: Internally mounted and labeled for copper and aluminum ground conductors.
  - 2. Neutral Kit: Internally mounted; insulated, capable of being grounded and bonded; labeled for copper and aluminum neutral conductors.
  - 3. Class R Fuse Kit: Provides rejection of other fuse types when Class R fuses are specified.
  - 4. Auxiliary Contact Kit: One NO/NC (Form "C") auxiliary contact(s), arranged to activate before switch blades open.

5. Hookstick Handle: Allows use of a hookstick to operate the handle.
6. Lugs: Mechanical type, suitable for number, size, and conductor material.

## 2.2 MOLDED-CASE CIRCUIT BREAKERS

- A. Manufacturers: Subject to compliance with requirements, provide products by one of the following:
  1. Eaton Electrical Inc.; Cutler-Hammer Business Unit.
  2. ABB-General Electric; GE Consumer & Industrial - Electrical Distribution.
  3. Siemens Energy & Automation, Inc.
  4. Square D; a brand of Schneider Electric.
  5. Or approved equal.
- B. General Requirements: Comply with UL 489, NEMA AB 1, and NEMA AB 3, with interrupting capacity to comply with available fault currents.
- C. Thermal-Magnetic Circuit Breakers: Inverse time-current element for low-level overloads and instantaneous magnetic trip element for short circuits. Adjustable magnetic trip setting for circuit-breaker frame sizes 250 A and larger.
- D. Adjustable, Instantaneous-Trip Circuit Breakers: Magnetic trip element with front-mounted, field-adjustable trip setting.
- E. Electronic Trip Circuit Breakers: Field-replaceable rating plug, rms sensing, with the following field-adjustable settings:
  1. Instantaneous trip.
  2. Long- and short-time pickup levels.
  3. Long- and short-time time adjustments.
  4. Ground-fault pickup level, time delay, and  $I^2t$  response.
- F. Features and Accessories:
  1. Standard frame sizes, trip ratings, and number of poles.
  2. Lugs: Mechanical type, suitable for number, size, trip ratings, and conductor material.
  3. Application Listing: Appropriate for application; Type SWD for switching fluorescent lighting loads; Type HID for feeding fluorescent and high-intensity discharge lighting circuits.
  4. Auxiliary Contacts: One SPDT switch with "a" and "b" contacts; "a" contacts mimic circuit-breaker contacts, "b" contacts operate in reverse of circuit-breaker contacts.
  5. Alarm Switch: One NO contact that operates only when circuit breaker has tripped.

## 2.3 ENCLOSURES

- A. Enclosed Switches and Circuit Breakers: NEMA AB 1, NEMA KS 1, NEMA 250, and UL 50, to comply with environmental conditions at installed location.
  1. Indoor, Dry and Clean Locations: NEMA 250, Type 1.

2. Outdoor Locations: NEMA 250, Type 3R.
3. Other Wet or Damp, Indoor Locations: NEMA 250, Type 4.
4. Indoor Locations Subject to Dust, Falling Dirt, and Dripping Noncorrosive Liquids: NEMA 250, Type 12.

## **PART 3 - EXECUTION**

### **3.1 EXAMINATION**

- A. Examine elements and surfaces to receive enclosed switches and circuit breakers for compliance with installation tolerances and other conditions affecting performance of the Work.
- B. Proceed with installation only after unsatisfactory conditions have been corrected.

### **3.2 INSTALLATION**

- A. Install individual wall-mounted switches and circuit breakers with tops at uniform height unless otherwise indicated.
- B. Comply with mounting and anchoring requirements specified in Division 26.
- C. Temporary Lifting Provisions: Remove temporary lifting eyes, channels, and brackets and temporary blocking of moving parts from enclosures and components.
- D. Install fuses in fusible devices.
- E. Comply with NECA 1.

### **3.3 IDENTIFICATION**

- A. Comply with requirements in Division 26.
  1. Identify field-installed conductors, interconnecting wiring, and components; provide warning signs.
  2. Label each enclosure with engraved metal or laminated-plastic nameplate.

### **3.4 FIELD QUALITY CONTROL**

- A. Perform tests and inspections.
- B. Acceptance Testing Preparation:
  1. Test insulation resistance for each enclosed switch and circuit breaker, component, connecting supply, feeder, and control circuit.
  2. Test continuity of each circuit.
- C. Tests and Inspections:
  1. Perform each visual and mechanical inspection and electrical test stated in NETA Acceptance Testing Specification. Certify compliance with test parameters.
  2. Correct malfunctioning units on-site, where possible, and retest to demonstrate compliance; otherwise, replace with new units and retest.

3. Test and adjust controls, remote monitoring, and safeties. Replace damaged and malfunctioning controls and equipment.
- D. Enclosed switches and circuit breakers will be considered defective if they do not pass tests and inspections.
- E. Prepare test and inspection reports. Include notation of deficiencies detected, remedial action taken, and observations after remedial action.

### 3.5 ADJUSTING

- A. Adjust moving parts and operable components to function smoothly, and lubricate as recommended by manufacturer.
- B. Set field-adjustable circuit-breaker trip ranges as specified in Division 26.

END OF SECTION

H:\Y0586.00\DOC\SPEC\2025\_02-20\_IFB\262816\_ENCLOSED SWITCHES AND CIRCUIT BREAKERS.DOC

## SECTION 262913 - ENCLOSED CONTROLLERS

### PART 1 - GENERAL

#### 1.1 RELATED DOCUMENTS

- A. Certain requirements common to all the mechanical and electrical trades (Fire Suppression, Plumbing, HVAC, Electrical, and Tele/Data) are specified in Division 20. To avoid repetition, they are not repeated in each relevant Division and Section. However, these requirements are applicable to the work of this Section and are hereby incorporated by reference.
- B. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.

#### 1.2 SUMMARY

- A. Section includes the following enclosed controllers rated 600 V and less:
  - 1. Full-voltage manual.

#### 1.3 DEFINITIONS

- A. CPT: Control power transformer.
- B. MCCB: Molded-case circuit breaker.
- C. MCP: Motor circuit protector.
- D. N.C.: Normally closed.
- E. N.O.: Normally open.
- F. OCPD: Overcurrent protective device.
- G. SCR: Silicon-controlled rectifier.

#### 1.4 SUBMITTALS

- A. Product Data: For each type of enclosed controller. Include manufacturer's technical data on features, performance, electrical characteristics, ratings, and enclosure types and finishes.
- B. Shop Drawings: For each enclosed controller. Include dimensioned plans, elevations, sections, details, and required clearances and service spaces around controller enclosures.
  - 1. Show tabulations of the following:
    - a. Each installed unit's type and details.
    - b. Factory-installed devices.
    - c. Nameplate legends.
    - d. Short-circuit current rating of integrated unit.
    - e. Listed and labeled for integrated short-circuit current (withstand) rating of OCPDs in combination controllers by an NRTL acceptable to authorities having jurisdiction.

- f. Features, characteristics, ratings, and factory settings of individual OCPDs in combination controllers.
    - 2. Wiring Diagrams: For power, signal, and control wiring.
  - C. Qualification Data: For qualified testing agency.
  - D. Field quality-control reports.
  - E. Operation and Maintenance Data: For enclosed controllers to include in emergency, operation, and maintenance manuals. In addition to items specified in Division 01 include the following:
    - 1. Routine maintenance requirements for enclosed controllers and installed components.
    - 2. Manufacturer's written instructions for setting field-adjustable overload relays.
- 1.5 QUALITY ASSURANCE
- A. Electrical Components, Devices, and Accessories: Listed and labeled as defined in NFPA 70, by a qualified testing agency, and marked for intended location and application.
  - B. Comply with NFPA 70.
- 1.6 DELIVERY, STORAGE, AND HANDLING
- A. Store enclosed controllers indoors in clean, dry space with uniform temperature to prevent condensation. Protect enclosed controllers from exposure to dirt, fumes, water, corrosive substances, and physical damage.
- 1.7 PROJECT CONDITIONS
- A. Environmental Limitations: Rate equipment for continuous operation under the following conditions unless otherwise indicated:
    - 1. Ambient Temperature: Not less than minus 22 deg F and not exceeding 104 deg F.
    - 2. Altitude: Not exceeding 6600 feet.
  - B. Interruption of Existing Electrical Systems: Do not interrupt electrical systems in facilities occupied by Owner or others unless permitted under the following conditions and then only after arranging to provide temporary electrical service according to requirements indicated:
    - 1. Notify Owner no fewer than seven days in advance of proposed interruption of electrical systems.
    - 2. Indicate method of providing temporary utilities.
    - 3. Do not proceed with interruption of electrical systems without Owner's written permission.
    - 4. Comply with NFPA 70E.
- 1.8 COORDINATION
- A. Coordinate layout and installation of enclosed controllers with other construction including conduit, piping, equipment, and adjacent surfaces. Maintain required workspace clearances and required clearances for equipment access doors and panels.
  - B. Coordinate installation of roof curbs, equipment supports, and roof penetrations.

## PART 2 - PRODUCTS

### 2.1 FULL-VOLTAGE CONTROLLERS

- A. General Requirements for Full-Voltage Controllers: Comply with NEMA ICS 2, general purpose, Class A.
- B. Motor-Starting Switches: "Quick-make, quick-break" toggle or push-button action; marked to show whether unit is off or on.
  - 1. Manufacturers: Subject to compliance with requirements, manufacturers offering products that may be incorporated into the Work include, but are not limited to, the following:
    - a. Eaton Electrical Inc.; Cutler-Hammer Business Unit.
    - b. ABB-General Electric; GE Consumer & Industrial - Electrical Distribution.
    - c. Rockwell Automation, Inc.; Allen-Bradley brand.
    - d. Siemens Energy & Automation, Inc.
    - e. Square D; a brand of Schneider Electric.
  - 2. Configuration: Nonreversing.
  - 3. Surface mounting.
  - 4. Red pilot light.
- C. Fractional Horsepower Manual Controllers: "Quick-make, quick-break" toggle or push-button action; marked to show whether unit is off, on, or tripped.
  - 1. Manufacturers: Subject to compliance with requirements, manufacturers offering products that may be incorporated into the Work include, but are not limited to, the following:
    - a. Eaton Electrical Inc.; Cutler-Hammer Business Unit.
    - b. ABB-General Electric; GE Consumer & Industrial - Electrical Distribution.
    - c. Rockwell Automation, Inc.; Allen-Bradley brand.
    - d. Siemens Energy & Automation, Inc.
    - e. Square D; a brand of Schneider Electric.
  - 2. Configuration: Nonreversing.
  - 3. Overload Relays: Inverse-time-current characteristics; NEMA ICS 2, Class 10 tripping characteristics; heaters matched to nameplate full-load current of actual protected motor; external reset push button; bimetallic type.
  - 4. Surface mounting.
  - 5. Red pilot light.
- D. Combination Magnetic Controller: Factory-assembled combination of magnetic controller, OCPD, and disconnecting means.

1. Manufacturers: Subject to compliance with requirements, manufacturers offering products that may be incorporated into the Work include, but are not limited to, the following:
  - a. Eaton Electrical Inc.; Cutler-Hammer Business Unit.
  - b. ABB-General Electric; GE Consumer & Industrial - Electrical Distribution.
  - c. Rockwell Automation, Inc.; Allen-Bradley brand.
  - d. Siemens Energy & Automation, Inc.
  - e. Square D; a brand of Schneider Electric.
2. Fusible Disconnecting Means:
  - a. NEMA KS 1, heavy-duty, horsepower-rated, fusible switch with clips or bolt pads to accommodate Class R fuses.
  - b. Lockable Handle: Accepts three padlocks and interlocks with cover in closed position.
  - c. Auxiliary Contacts: N.O./N.C., arranged to activate before switch blades open.
3. MCP Disconnecting Means:
  - a. UL 489, NEMA AB 1, and NEMA AB 3, with interrupting capacity to comply with available fault currents, instantaneous-only circuit breaker with front-mounted, field-adjustable, short-circuit trip coordinated with motor locked-rotor amperes.
  - b. Lockable Handle: Accepts three padlocks and interlocks with cover in closed position.
  - c. Auxiliary contacts "a" and "b" arranged to activate with MCP handle.
  - d. N.O. alarm contact that operates only when MCP has tripped.

## 2.2 ENCLOSURES

- A. Enclosed Controllers: NEMA ICS 6, to comply with environmental conditions at installed location.
  1. Dry and Clean Indoor Locations: Type 1.
  2. Outdoor Locations: Type 3R.
  3. Kitchen Areas: Type 4X, stainless steel.
  4. Other Wet or Damp Indoor Locations: Type 4.

## 2.3 ACCESSORIES

- A. General Requirements for Control Circuit and Pilot Devices: NEMA ICS 5; factory installed in controller enclosure cover unless otherwise indicated.
  1. Push Buttons, Pilot Lights, and Selector Switches: Heavy-duty, oiltight type.
    - a. Push Buttons: Covered types; momentary as indicated.
    - b. Pilot Lights: LED types; colors as indicated; push to test.

- c. Selector Switches: Rotary type.
- B. Reversible N.C./N.O. auxiliary contact(s).
- C. Control Relays: Auxiliary and adjustable solid-state time-delay relays.
- D. Sun shields installed on fronts, sides, and tops of enclosures installed outdoors and subject to direct and extended sun exposure.
- E. Cover gaskets for Type 1 enclosures.

### **PART 3 - EXECUTION**

#### **3.1 EXAMINATION**

- A. Examine areas and surfaces to receive enclosed controllers, with Installer present, for compliance with requirements and other conditions affecting performance of the Work.
- B. Proceed with installation only after unsatisfactory conditions have been corrected.

#### **3.2 INSTALLATION**

- A. Wall-Mounted Controllers: Install enclosed controllers on walls with tops at uniform height unless otherwise indicated, and by bolting units to wall or mounting on lightweight structural-steel channels bolted to wall. For controllers not at walls, provide freestanding racks complying with Division 26.
- B. Temporary Lifting Provisions: Remove temporary lifting eyes, channels, and brackets and temporary blocking of moving parts from enclosures and components.
- C. Install fuses in each fusible-switch enclosed controller.
- D. Install fuses in control circuits if not factory installed. Comply with requirements in Division 26.
- E. Install heaters in thermal overload relays. Select heaters based on actual nameplate full-load amperes after motors have been installed.
- F. Install, connect, and fuse thermal-protector monitoring relays furnished with motor-driven equipment.
- G. Comply with NECA 1.

#### **3.3 IDENTIFICATION**

- A. Identify enclosed controllers, components, and control wiring. Comply with requirements for identification specified in Division 26.
  - 1. Identify field-installed conductors, interconnecting wiring, and components; provide warning signs.
  - 2. Label each enclosure with engraved nameplate.
  - 3. Label each enclosure-mounted control and pilot device.

3.4 CONTROL WIRING INSTALLATION

- A. Bundle, train, and support wiring in enclosures.

3.5 FIELD QUALITY CONTROL

- A. Perform tests and inspections.
- B. Acceptance Testing Preparation:
  - 1. Test insulation resistance for each enclosed controller, component, connecting supply, feeder, and control circuit.
  - 2. Test continuity of each circuit.
- C. Tests and Inspections:
  - 1. Inspect controllers, wiring, components, connections, and equipment installation. Test and adjust controllers, components, and equipment.
  - 2. Test insulation resistance for each enclosed-controller element, component, connecting motor supply, feeder, and control circuits.
  - 3. Test continuity of each circuit.
  - 4. Verify that voltages at controller locations are within plus or minus 10 percent of motor nameplate rated voltages. If outside this range for any motor, notify Owner before starting the motor(s).
  - 5. Test each motor for proper phase rotation.
  - 6. Perform each electrical test and visual and mechanical inspection stated in NETA Acceptance Testing Specification. Certify compliance with test parameters.
  - 7. Correct malfunctioning units on-site, where possible, and retest to demonstrate compliance; otherwise, replace with new units and retest.
  - 8. Test and adjust controls, remote monitoring, and safeties. Replace damaged and malfunctioning controls and equipment.
- D. Enclosed controllers will be considered defective if they do not pass tests and inspections.
- E. Prepare test and inspection reports including a certified report that identifies enclosed controllers and that describes scanning results. Include notation of deficiencies detected, remedial action taken, and observations after remedial action.

3.6 ADJUSTING

- A. Set field-adjustable switches, auxiliary relays, time-delay relays, timers, and overload-relay pickup and trip ranges.
- B. Adjust overload-relay heaters or settings if power factor correction capacitors are connected to the load side of the overload relays.
- C. Adjust the trip settings of MCPs and thermal-magnetic circuit breakers with adjustable instantaneous trip elements. Initially adjust to six times the motor nameplate full-load ampere ratings and attempt to start motors several times, allowing for motor cooldown between starts. If tripping occurs on motor inrush, adjust settings in increments until motors start without tripping. Do not exceed eight times the motor full-load amperes (or 11 times for NEMA

Premium Efficient motors if required). Where these maximum settings do not allow starting of a motor, notify Owner before increasing settings.

3.7 PROTECTION

- A. Temporary Heating: Apply temporary heat to maintain temperature according to manufacturer's written instructions until enclosed controllers are ready to be energized and placed into service.
- B. Replace controllers whose interiors have been exposed to water or other liquids prior to Substantial Completion.

3.8 DEMONSTRATION

- A. Train Owner's maintenance personnel to adjust, operate, and maintain enclosed controllers.

END OF SECTION

H:\Y0586.00\DOC\SPEC\2025\_02-20\_IFB\262913\_ENCLOSED CONTROLLERS.DOC

## SECTION 262923 - VARIABLE-FREQUENCY CONTROLLERS

### PART 1 - GENERAL

#### 1.1 RELATED DOCUMENTS

- A. Certain requirements common to all the mechanical and electrical trades (Fire Suppression, Plumbing, HVAC, Electrical, and Tele/Data) are specified in Division 20. To avoid repetition, they are not repeated in each relevant Division and Section. However, these requirements are applicable to the work of this Section and are hereby incorporated by reference.
- B. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.

#### 1.2 SUMMARY

- A. This Section includes solid-state, PWM, VFCs for speed control of three-phase, squirrel-cage induction motors.

#### 1.3 DEFINITIONS

- A. BMS: Building management system.
- B. IGBT: Integrated gate bipolar transistor.
- C. LAN: Local area network.
- D. PID: Control action, proportional plus integral plus derivative.
- E. PWM: Pulse-width modulated.
- F. VFC: Variable frequency controller.

#### 1.4 SUBMITTALS

- A. Compliance to IEEE 519 – harmonic analysis for particular jobsite including total harmonic voltage distortion and total harmonic current distortion (TDD).
  - 1. The VFC manufacturer shall provide calculations; specific to this installation, showing total harmonic voltage distortion is less than 5%. Input line filters shall be sized and provided as required by the VFC manufacturer to ensure compliance with IEEE standard 519. All VFCs shall include a minimum of 5% impedance reactors, no exceptions.
    - a. The calculations shall be performed using the harmonics analysis software SKM Power Tools for Windows Hi-Wave module or similar type analysis software. The intent is to include the entire electrical distribution system impedance in the harmonics analysis.
    - b. The Point of Common Coupling shall be the main switchboard or switchgear for the building.
- B. Product Data: For each type of VFC. Include dimensions, mounting arrangements, location for conduit entries, shipping and operating weights, and manufacturer's technical data on features, performance, electrical ratings, characteristics, and finishes.
- C. Shop Drawings: For each VFC.

1. Include dimensioned plans, elevations, sections, and details, including required clearances and service space around equipment. Show tabulations of installed devices, equipment features, and ratings. Include the following:
    - a. Each installed unit's type and details.
    - b. Nameplate legends.
    - c. Short-circuit current rating of integrated unit.
    - d. Listed and labeled for series rating of overcurrent protective devices in combination controllers by an NRTL acceptable to authorities having jurisdiction.
    - e. Features, characteristics, ratings, and factory settings of each motor-control center unit.
  2. Wiring Diagrams: Power, signal, and control wiring for VFCs. Provide schematic wiring diagram for each type of VFC.
- D. Coordination Drawings: Floor plans, drawn to scale, showing dimensioned layout, required working clearances, and required area above and around VFCs where pipe and ducts are prohibited. Show VFC layout and relationships between electrical components and adjacent structural and mechanical elements. Show support locations, type of support, and weight on each support. Indicate field measurements.
- E. Qualification Data
1. VFCs and options shall be UL listed as a complete assembly. VFCs that require the customer to supply external fuses for the VFC to be UL listed are not acceptable. The base VFC shall be UL listed for 100 KAIC without the need for input fuses.
  2. The VFC manufacturer shall have available a comprehensive, HVAC Drive Computer Based Training (CBT) product. The CBT product shall include detailed, interactive sections covering VFC unpacking, proper mechanical and electrical installation, and programming. The CBT product shall allow the user to provide just-in-time training to new personnel or refresher training for maintenance and repair personnel on the user's site. The CBT product shall be repeatable, precise and shall include record keeping capability. The CBT product shall record answers to simulations and tests by student ID. The CBT product must be professionally produced and have interactive sections, student tests, and include video clips of proper wiring and installation.
- F. Field quality-control test reports.
- G. Operation and Maintenance Data: For VFCs, all installed devices, and components to include in emergency, operation, and maintenance manuals. In addition to items specified in Division 01, include the following:
1. Routine maintenance requirements for VFCs and all installed components.
- 1.5 QUALITY ASSURANCE
- A. Manufacturer Qualifications: A qualified manufacturer. Maintain, within 100 miles of Project site, a service center capable of providing training, parts, and emergency maintenance and repairs.
- B. Source Limitations: Obtain VFCs of a single type through one source from a single manufacturer.

- C. Electrical Components, Devices, and Accessories: Listed and labeled as defined in NFPA 70, Article 100, by a testing agency acceptable to authorities having jurisdiction, and marked for intended use.
- D. Comply with NFPA 70.
- E. Referenced Standards:
  - 1. Institute of Electrical and Electronic Engineers (IEEE)
    - a. Standard 519-1992, IEEE Guide for Harmonic Content and Control.
  - 2. Underwriters laboratories
    - a. UL508C
  - 3. National Electrical Manufacturer's Association (NEMA)
    - a. ICS 7.0, AC Adjustable Speed Drives
  - 4. IEC 16800 Parts 1 and 2

#### 1.6 DELIVERY, STORAGE, AND HANDLING

- A. Deliver VFCs in shipping splits of lengths that can be moved past obstructions in delivery path as indicated.
- B. Store VFCs indoors in clean, dry space with uniform temperature to prevent condensation. Protect VFCs from exposure to dirt, fumes, water, corrosive substances, and physical damage.
- C. If stored in areas subject to weather, cover VFCs to protect them from weather, dirt, dust, corrosive substances, and physical damage. Remove loose packing and flammable materials from inside controllers; install electric heating of sufficient wattage to prevent condensation.

#### 1.7 PROJECT CONDITIONS

- A. Environmental Limitations: Rate equipment for continuous operation, capable of driving full load without de-rating, under the following conditions, unless otherwise indicated:
  - 1. Ambient Temperature: 0 to 40 deg C.
  - 2. Humidity: Less than 90 percent (non-condensing).
  - 3. Altitude: Not exceeding 3300 feet.

#### 1.8 COORDINATION

- A. Coordinate layout and installation of VFCs with other construction including conduit, piping, equipment, and adjacent surfaces. Maintain required workspace clearances and required clearances for equipment access doors and panels.
- B. Coordinate size and location of concrete bases. Cast anchor-bolt inserts into bases. Concrete, reinforcement, and formwork requirements are specified in Division 03.
- C. Coordinate installation of roof curbs, equipment supports, and roof penetrations. These items are specified in Division 07.
- D. Coordinate features of VFCs, installed units, and accessory devices with pilot devices and control circuits to which they connect.

- E. Coordinate features, accessories, and functions of each VFC and each installed unit with ratings and characteristics of supply circuit, motor, required control sequence, and duty cycle of motor and load.

#### 1.9 EXTRA MATERIALS

- A. Furnish extra materials described below that match products installed and that are packaged with protective covering for storage and identified with labels describing contents.
  - 1. Spare Fuses: Furnish one spare for every five installed, but no less than one set of three of each type and rating.
  - 2. Indicating Lights: Two of each type installed.

### PART 2 - PRODUCTS

#### 2.1 MANUFACTURERS

- A. Manufacturers: Subject to compliance with requirements, provide products by one of the following:
  - 1. ABB, Inc.
  - 2. Yaskawa
  - 3. Danfoss Inc.; Danfoss Electronic Drives Div.
  - 4. Eaton Corporation; Cutler-Hammer Products.
  - 5. ABB-General Electric; GE Industrial Systems.
  - 6. Square D.
  - 7. Toshiba International Corporation.
  - 8. Or approved equal.

#### 2.2 VARIABLE FREQUENCY CONTROLLERS

- A. Description: NEMA ICS 2, IGBT, PWM, VFC; listed and labeled as a complete unit and arranged to provide variable speed of an NEMA MG 1, Design B, 3-phase induction motor by adjusting output voltage and frequency.
  - 1. Provide unit suitable for operation of premium-efficiency motor as defined by NEMA MG 1.
  - 2. VFCs shall be 6 pulse design with 5 percent input impedance. All components shall be integrally mounted and wired in a single enclosure.
- B. Design and Rating: Match load type such as fans, blowers, and pumps; and type of connection used between motor and load such as direct or through a power-transmission connection.
- C. The VFC package as specified herein shall be enclosed in a UL Listed Type 12 enclosure, completely assembled and tested by the manufacturer in an ISO9001 facility. The VFC tolerated voltage window shall allow the VFC to operate from a line of +30 percent nominal, and -35 percent nominal voltage as a minimum.
- D. Output Rating: 3-phase; 6 to 60 Hz, with voltage proportional to frequency throughout voltage range.

- E. Unit Operating Requirements:
  - 1. Input ac voltage tolerance of 208 V, plus or minus 5, 380 to 500 V, plus or minus 10.
  - 2. Input frequency tolerance of 50/60 Hz, plus or minus 6 percent.
  - 3. Minimum Efficiency: 96 percent at 60 Hz, full load.
  - 4. Minimum Displacement Primary-Side Power Factor: 96 percent.
  - 5. Overload Capability: 1.1 times the base load current for 60 seconds; 2.0 times the base load current for 3 seconds.
  - 6. Starting Torque: 100 percent of rated torque or as indicated.
  - 7. Speed Regulation: Plus or minus 1 percent.
- F. Isolated control interface to allow controller to follow control signal over an 11:1 speed range.
  - 1. Electrical Signal: 4 to 20 mA at 24 V.
- G. Internal Adjustability Capabilities:
  - 1. Minimum Speed: 5 to 25 percent of maximum rpm.
  - 2. Maximum Speed: 80 to 100 percent of maximum rpm.
  - 3. Acceleration: 2 to a minimum of 22 seconds.
  - 4. Deceleration: 2 to a minimum of 22 seconds.
  - 5. Current Limit: 50 to a minimum of 110 percent of maximum rating.
- H. Self-Protection and Reliability Features:
  - 1. Input transient protection.
    - a. The VFC shall include a coordinated AC transient protection system consisting of 4-120 joule rated MOVs (phase to phase and phase to ground), a capacitor clamp, and 5% impedance reactors.
  - 2. Under- and overvoltage trips; inverter over temperature, overload, and overcurrent trips.
  - 3. Motor Overload Relay: Adjustable and capable of NEMA ICS 2, Class 10 performance.
  - 4. Notch filter to prevent operation of the controller-motor-load combination at a natural frequency of the combination.
  - 5. Three (3) programmable critical frequency lockout ranges to prevent the VFC from operating the load continuously at an unstable speed.
  - 6. Instantaneous line-to-line and line-to-ground overcurrent trips.
  - 7. Loss-of-phase protection.
  - 8. Reverse-phase protection.
  - 9. Short-circuit protection.
  - 10. Motor over temperature fault.
- I. Multiple-Motor Capability: Controller suitable for service to multiple motors and having a separate overload relay and protection for each controlled motor. Overload relay shall shut off controller and motors served by it when overload relay is tripped.

- J. Automatic Reset/Restart: Attempts three restarts after controller fault or on return of power after an interruption and before shutting down for manual reset or fault correction. Bidirectional autopsied search shall be capable of starting into rotating loads spinning in either direction and returning motor to set speed in proper direction, without damage to controller, motor, or load.
- K. Power-Interruption Protection: To prevent motor from re-energizing after a power interruption until motor has stopped.
- L. Torque Boost: Automatically varies starting and continuous torque to at least 1.5 times the minimum torque to ensure high-starting torque and increased torque at slow speeds.
- M. Motor Temperature Compensation at Slow Speeds: Adjustable current fall-back based on output frequency for temperature protection of self-cooled, fan-ventilated motors at slow speeds.
- N. Input Line Conditioning
  - 1. The VFC shall have an integral 5 percent impedance line reactors to reduce the harmonics to the power line and to add protection from AC line transients. The 5 percent impedance may be from dual (positive and negative DC bus) reactors, or 5 percent AC line reactors. VFCs with only one DC reactor shall add AC line reactors.
- O. VFC Output Filtering: The VFC shall be constructed to limit output voltage spikes. Include an output DV/DT filter to limit voltage spikes at the motor. The filter shall be housed integral to the VFC or in an enclosure adjacent to the VFC.
- P. Status Lights: Door-mounted LED indicators shall indicate the following conditions:
  - 1. Power on.
  - 2. Run.
  - 3. Overvoltage.
  - 4. Line fault.
  - 5. Overcurrent.
  - 6. External fault.
- Q. Panel-Mounted Operator Station (Keypad): Start-stop and auto-manual selector switches with manual speed control potentiometer and elapsed time meter.
- R. Indicating Devices: Meters or digital readout devices and selector switch, mounted flush in controller door and connected to indicate the following controller parameters:
  - 1. Output frequency (Hz).
  - 2. Motor speed (rpm).
  - 3. Motor status (running, stop, fault).
  - 4. Motor current (amperes).
  - 5. Motor torque (percent).
  - 6. Fault or alarming status (code).
  - 7. PID feedback signal (percent).
  - 8. DC-link voltage (VDC).

9. Set-point frequency (Hz).
  10. Motor output voltage (V).
- S. Control Signal Interface:
1. Electric Input Signal Interface: A minimum of 2 analog inputs (0 to 10 V or 0/4-20 mA) and 6 programmable digital inputs.
  2. Remote Signal Inputs: Capability to accept any of the following speed-setting input signals from the BMS or other control systems:
    - a. 0 to 10-V dc.
    - b. 0-20 or 4-20 mA.
    - c. Potentiometer using up/down digital inputs.
    - d. Fixed frequencies using digital inputs.
    - e. RS485.
    - f. Keypad display for local hand operation.
  3. Output Signal Interface:
    - a. A minimum of 1 analog output signal (0/4-20 mA), which can be programmed to any of the following:
      - 1) Output frequency (Hz).
      - 2) Output current (load).
      - 3) DC-link voltage (VDC).
      - 4) Motor torque (percent).
      - 5) Motor speed (rpm).
      - 6) Set-point frequency (Hz).
  4. Remote Indication Interface: A minimum of 2 dry circuit relay outputs (120-V ac, 1 A) for remote indication of the following:
    - a. Motor running.
    - b. Set-point speed reached.
    - c. Fault and warning indication (over temperature or overcurrent).
    - d. PID high- or low-speed limits reached.
- T. Communications
1. The VFC shall have an RS-485 port as standard. The standard protocols shall be Modbus, Johnson Controls N2 bus, and Siemens Building Technologies FLN. Optional protocols for LonWorks, BACnet, Profibus, Ethernet, and DeviceNet shall be available. Each individual drive shall have the protocol in the base VFC. The use of third party gateways and multiplexers is not acceptable. All protocols shall be “certified” by the governing authority. Use of non-certified protocols is not allowed.
  2. The BACnet connection shall be an RS485, MSTP interface operating at 9.6, 19.2, 38.4, or 76.8 Kbps. The connection shall be tested by the BACnet Testing Labs (BTL) and be BTL Listed. The BACnet interface shall conform to the BACnet standard device type of

an Applications Specific Controller (B-ASC). The interface shall support all BIBBs defined by the BACnet standard profile for a B-ASC including, but not limited to:

- a. Data Sharing – Read Property – B.
  - b. Data Sharing – Write Property – B.
  - c. Device Management – Dynamic Device Binding (Who-Is; I-AM).
  - d. Device Management – Dynamic Object Binding (Who-Has; I-Have).
  - e. Device Management – Communication Control – B.
  - f. If additional hardware is required to obtain the BACnet interface, the VFC manufacturer shall supply one BACnet gateway per drive. Multiple VFCs sharing one gateway shall not be acceptable.
3. Serial communication capabilities shall include, but not be limited to; run-stop control, speed set adjustment, proportional/integral/derivative PID control adjustments, current limit, accel/decel time adjustments, and lock and unlock the keypad. The drive shall have the capability of allowing the DDC to monitor feedback such as process variable feedback, output speed / frequency, current (in amps), percent torque, power (kW), kilowatt hours (resettable), operating hours (resettable), and drive temperature. The DDC shall also be capable of monitoring the VFC relay output status, digital input status, and all analog input and analog output values. All diagnostic warning and fault information shall be transmitted over the serial communications bus. Remote VFC fault reset shall be possible. The following additional status indications and settings shall be transmitted over the serial communications bus – keypad “Hand” or “Auto” selected, bypass selected, the ability to change the PID setpoint, and the ability to force the unit to bypass (if bypass is specified). The DDC system shall also be able to monitor if the motor is running in the VFC mode or bypass mode (if bypass is specified) over serial communications. A minimum of 15 field parameters shall be capable of being monitored.
  4. The VFC shall allow the DDC to control the drive’s digital and analog outputs via the serial interface. This control shall be independent of any VFC function. For example, the analog outputs may be used for modulating chilled water valves or cooling tower bypass valves. The drive’s digital (relay) outputs may be used to actuate a damper, open a valve or control any other device that requires a maintained contact for operation. In addition, all of the drive’s digital and analog inputs shall be capable of being monitored by the DDC system.
  5. The VFC shall include an independent PID loop for customer use. The independent PID loop may be used for cooling tower bypass value control, chilled water value control, etc. Both the VFC control PID loop and the independent PID loop shall continue functioning even if the serial communications connection is lost. The VFC shall keep the last good set-point command and last good DO and AO commands in memory in the event the serial communications connection is lost.

## 2.3 ENCLOSURES

- A. The VFC package as specified herein shall be enclosed in a UL listed Type 12 enclosure, completely assembled and tested by the manufacturer in an ISO9001 facility. The VFC tolerated voltage window shall allow the VFC to operate from a line of +30 percent nominal voltage as a minimum.

## 2.4 ACCESSORIES

- A. Devices shall be factory installed in controller enclosure, unless otherwise indicated.
- B. Control Relays: Auxiliary and adjustable time-delay relays.
- C. Standard Displays:
  - 1. Output frequency (Hz).
  - 2. Set-point frequency (Hz).
  - 3. Motor current (amperes).
  - 4. DC-link voltage (VDC).
  - 5. Motor torque (percent).
  - 6. Motor speed (rpm).
  - 7. Motor output voltage (V).
- D. Historical Logging Information and Displays:
  - 1. Real-time clock with current time and date.
  - 2. Running log of total power versus time.
  - 3. Total run time.
  - 4. Fault log, maintaining last four faults with time and date stamp for each.

## 2.5 FACTORY FINISHES

- A. Finish: Manufacturer's standard paint applied to factory-assembled and -tested VFCs before shipping.

## PART 3 - EXECUTION

### 3.1 EXAMINATION

- A. Examine areas, surfaces, and substrates to receive VFCs for compliance with requirements, installation tolerances, and other conditions affecting performance.
- B. Examine roughing-in for conduit systems to verify actual locations of conduit connections before VFC installation.
- C. Proceed with installation only after unsatisfactory conditions have been corrected.

### 3.2 APPLICATIONS

- A. Select features of each VFC to coordinate with ratings and characteristics of supply circuit and motor; required control sequence; and duty cycle of motor, controller, and load.
- B. Select horsepower rating of controllers to suit motor controlled.

### 3.3 INSTALLATION

- A. Anchor each VFC assembly to steel-channel sills arranged and sized according to manufacturer's written instructions. Attach by bolting. Level and grout sills flush with mounting surface.

- B. Controller Fuses: Install fuses in each fusible switch. Comply with requirements in Division 26.

### 3.4 IDENTIFICATION

- A. Identify VFCs, components, and control wiring according to Division 26.
- B. Operating Instructions: Frame printed operating instructions for VFCs, including control sequences and emergency procedures. Fabricate frame of finished metal, and cover instructions with clear acrylic plastic. Mount on front of VFC units.

### 3.5 CONTROL WIRING INSTALLATION

- A. Install wiring between VFCs and remote devices according to Division 26.
- B. Bundle, train, and support wiring in enclosures.
- C. Connect hand-off-automatic switch and other automatic-control devices where applicable.
  - 1. Connect selector switches to bypass only manual- and automatic-control devices that have no safety functions when switch is in hand position.
  - 2. Connect selector switches with control circuit in both hand and automatic positions for safety-type control devices such as low- and high-pressure cutouts, high-temperature cutouts, and motor overload protectors.

### 3.6 CONNECTIONS

- A. Conduit installation requirements are specified in other Division 26 Sections. Drawings indicate general arrangement of conduit, fittings, and specialties.
- B. Ground equipment according to Division 26.

### 3.7 FIELD QUALITY CONTROL

- A. Prepare for acceptance tests as follows:
  - 1. Test insulation resistance for each enclosed controller element, bus, component, connecting supply, feeder, and control circuit.
  - 2. Test continuity of each circuit.
- B. Manufacturer's Field Service: Certified factory start-up shall be provided for each drive by a factory authorized service center. A certified start-up form shall be filled out for each drive with a copy provided to the owner, and a copy kept on file at the manufacturer.
  - 1. Inspect controllers, wiring, components, connections, and equipment installation. Test and adjust controllers, components, and equipment.
  - 2. Assist in field testing of equipment including pretesting and adjusting of solid-state controllers.
  - 3. Report results in writing.
- C. Warranty
  - 1. Warranty shall be 24 months from the date of certified start-up, not to exceed 30 months from the date of shipment. The warranty shall include all parts, labor, travel time and expenses. There shall be 365/24 support available via a toll free phone number.
- D. Perform the following field tests and inspections and prepare test reports:

1. Perform each electrical test and visual and mechanical inspection, except optional tests, stated in NETA ATS. Certify compliance with test parameters.
2. Correct malfunctioning units on-site, where possible, and retest to demonstrate compliance; otherwise, replace with new units and retest.

3.8 ADJUSTING

- A. Set field-adjustable switches and circuit-breaker trip ranges.

3.9 DEMONSTRATION

- A. Engage a factory-authorized service representative to train Owner's maintenance personnel to adjust, operate, and maintain variable frequency controllers. Refer to Division 01.

END OF SECTION

## SECTION 263213 - ENGINE GENERATORS

### PART 1 - GENERAL

#### 1.1 RELATED DOCUMENTS

- A. Certain requirements common to all the mechanical and electrical trades (Fire Suppression, Plumbing, HVAC, Electrical, and Tele/Data) are specified in Division 20. To avoid repetition, they are not repeated in each relevant Division and Section. However, these requirements are applicable to the work of this Section and are hereby incorporated by reference.
- B. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.

#### 1.2 SUMMARY

- A. This Section includes packaged engine-generator sets for emergency power supply with the following features:
  - 1. Engine generator set
  - 2. Engine
  - 3. Control and monitoring
  - 4. Generator overcurrent and fault protection
  - 5. Generator exciter and voltage regulator
  - 6. Outdoor generator set enclosure
  - 7. Motors
  - 8. Vibration isolation devices
  - 9. Finishes
- B. Requirements for certification of completion (affidavit)
  - 1. Notify the Design Professional in writing that the life safety systems are complete at least five (5) working days prior to requesting final certification of completion ("affidavits") from the Architect/Engineer. The notification shall be in the form of a single formal document endorsed by an individual charged with management responsibility for all trades associated with the life safety systems.
  - 2. In order for an affidavit to be signed the generator and the emergency system shall be tested per NFPA 110
  - 3. NFPA 110 Acceptance Tests: Perform tests required by NFPA 110 that are additional to those specified herein. The NFPA test generally consists of a cold start, a 2 hour load test, a 5 minute cool down, a 100 percent load test and then another 2 hour load test for a total test time of 4 hours and 5 minutes.
  - 4. All completed testing forms shall be submitted to the Design Professional a minimum of two (2) days prior to requiring affidavits.

### 1.3 DEFINITIONS

- A. Operational Bandwidth: The total variation from the lowest to highest value of a parameter over the range of conditions indicated, expressed as a percentage of the nominal value of the parameter.

### 1.4 SUBMITTALS

- A. Product Data: For each type of packaged engine generator indicated. Include rated capacities, operating characteristics, and furnished specialties and accessories. In addition, include the following:
  - 1. Thermal damage curve for generator.
  - 2. Time-current characteristic curves for generator protective device.
- B. Shop Drawings: Detail equipment assemblies and indicate dimensions, weights, loads, required clearances, method of field assembly, components, and location and size of each field connection.
  - 1. Dimensioned outline plan and elevation drawings of engine-generator set and other components specified.
  - 2. Design Calculations: Signed and sealed by a qualified professional engineer. Calculate requirements for selecting vibration isolators and seismic restraints and for designing vibration isolation bases.
  - 3. Vibration Isolation Base Details: Signed and sealed by a qualified professional engineer. Detail fabrication, including anchorages and attachments to structure and to supported equipment. Include base weights.
  - 4. Wiring Diagrams: Power, signal, and control wiring.
  - 5. Over-current protection, relays, and control devices shall be identified and their ratings marked.
  - 6. Noise Emissions: Provide a submittal with suitably supported and documented noise emission calculations or measurement data to demonstrate compliance with noise levels outlined in the specification. The submittal shall ensure all aspects of noise emission from the unit have been included.
  - 7. Copy of blank NFPA 110 Acceptance Test form for review.
- C. Qualification Data: For installer and manufacturer.
- D. Source quality-control test reports.
  - 1. Certified summary of prototype-unit test report.
  - 2. Certified Test Reports: For components and accessories that are equivalent, but not identical, to those tested on prototype unit.
  - 3. Report of factory test on units to be shipped for this Project, showing evidence of compliance with specified requirements.
  - 4. Report of sound generation.
  - 5. Report of exhaust emissions showing compliance with applicable regulations.
  - 6. Certified Torsional Vibration Compatibility: Comply with NFPA 110.

- E. Field quality-control test reports.
- F. Operation and Maintenance Data: For packaged engine generators to include in emergency, operation, and maintenance manuals. In addition to items specified in Division 01, include the following:
  - 1. List of tools and replacement items recommended to be stored at Project for ready access. Include part and drawing numbers, current unit prices, and source of supply.
- G. Warranty: Special warranty specified in this Section.

#### 1.5 QUALITY ASSURANCE

- A. Installer Qualifications: Manufacturer's authorized representative who is trained and approved for installation of units required for this Project.
  - 1. Maintenance Proximity: Not more than four hours' normal travel time from Installer's place of business to Project site.
  - 2. Engineering Responsibility: Preparation of data for vibration isolators, including Shop Drawings, based on testing and engineering analysis of manufacturer's standard units in assemblies similar to those indicated for this Project.
- B. Manufacturer Qualifications: A qualified manufacturer. Maintain, within 200 miles of Project site, a service center capable of providing training, parts, and emergency maintenance repairs.
- C. Source Limitations: Obtain packaged generator sets and auxiliary components through one source from a single manufacturer.
- D. Electrical Components, Devices, and Accessories: Listed and labeled as defined in NFPA 70, Article 100, by a testing agency acceptable to authorities having jurisdiction, and marked for intended use.
- E. Comply with ASME B15.1.
- F. Comply with NFPA 37.
- G. Comply with NFPA 70.
- H. Comply with NFPA 110 requirements for Level 1 emergency power supply system.
- I. Comply with UL 2200.
- J. Engine Exhaust Emissions: Comply with applicable state and local government requirements.
- K. Noise Emission: Comply with applicable state and local government requirements for maximum noise level at adjacent property boundaries due to sound emitted by generator set including engine, engine exhaust, engine cooling-air intake and discharge, and other components of installation.

#### 1.6 PROJECT CONDITIONS

- A. Interruption of Existing Electrical Service: Do not interrupt electrical service to facilities occupied by Owner or others unless permitted under the following conditions and then only after arranging to provide temporary electrical service according to requirements indicated:
  - 1. Notify Owner no fewer than 14 days in advance of proposed interruption of electrical service.

2. Do not proceed with interruption of electrical service without Owner's written permission.

B. Environmental Conditions: Engine-generator system shall withstand the following environmental conditions without mechanical or electrical damage or degradation of performance capability:

1. Ambient Temperature: 5 to 40 deg C.
2. Altitude: Sea level to 1000 feet.

#### 1.7 COORDINATION

A. Coordinate size and location of concrete bases for package engine generators. Cast anchor-bolt inserts into bases. Concrete, reinforcement, and formwork requirements are specified in Division 03.

#### 1.8 WARRANTY

A. Special Warranty: Manufacturer's standard form in which manufacturer agrees to repair or replace components of packaged engine generators and associated auxiliary components that fail in materials or workmanship within specified warranty period.

1. Warranty Period: 2 years from date of Substantial Completion.

#### 1.9 MAINTENANCE SERVICE

A. Initial Maintenance Service: Beginning at Substantial Completion, provide 12 months' full maintenance by skilled employees of manufacturer's designated service organization. Include quarterly exercising to check for proper starting, load transfer, and running under load. Include routine preventive maintenance as recommended by manufacturer and adjusting as required for proper operation. Provide parts and supplies same as those used in the manufacture and installation of original equipment.

#### 1.10 EXTRA MATERIALS

A. Furnish extra materials described below that match products installed and that are packaged with protective covering for storage and identified with labels describing contents.

1. Fuses: One for every 10 of each type and rating, but no fewer than one of each.
2. Indicator Lamps: Two for every six of each type used, but no fewer than two of each.
3. Filters: One set each of lubricating oil, fuel, and combustion-air filters.

### PART 2 - PRODUCTS

#### 2.1 MANUFACTURERS

A. Available Manufacturers: Subject to compliance with requirements, manufacturers offering products that may be incorporated into the Work include, but are not limited to, the following:

1. Caterpillar; Engine Div.
2. Kohler Co.; Generator Division.

3. Onan/Cummins Power Generation; Industrial Business Group.
4. Or approved equal.

## 2.2 ENGINE-GENERATOR SET

- A. Factory-assembled and -tested, engine-generator set.
- B. Mounting Frame: Maintain alignment of mounted components without depending on concrete foundation; and have lifting attachments.
- C. Capacities and Characteristics:
  1. Power Output Ratings: Nominal ratings as indicated, with capacity as required to operate as a unit as evidenced by records of prototype testing.
  2. Output Connections: Three-phase, four wire.
  3. Nameplates: For each major system component to identify manufacturer's name and address, and model and serial number of component.
- D. Generator-Set Performance:
  1. Steady-State Voltage Operational Bandwidth: 3 percent of rated output voltage from no load to full load.
  2. Transient Voltage Performance: Not more than 20 percent variation for 50 percent step-load increase or decrease. Voltage shall recover and remain within the steady-state operating band within three seconds.
  3. Steady-State Frequency Operational Bandwidth: 0.5 percent of rated frequency from no load to full load.
  4. Steady-State Frequency Stability: When system is operating at any constant load within the rated load, there shall be no random speed variations outside the steady-state operational band and no hunting or surging of speed.
  5. Transient Frequency Performance: Less than 5 percent variation for 50 percent step-load increase or decrease. Frequency shall recover and remain within the steady-state operating band within five seconds.
  6. Output Waveform: At no load, harmonic content measured line to line or line to neutral shall not exceed 5 percent total and 3 percent for single harmonics. Telephone influence factor, determined according to NEMA MG 1, shall not exceed 50 percent.
  7. Sustained Short-Circuit Current: For a 3-phase, bolted short circuit at system output terminals, system shall supply a minimum of 250 percent of rated full-load current for not less than 10 seconds and then clear the fault automatically, without damage to generator system components.
  8. Start Time: Comply with NFPA 110, Type 10, system requirements.

## 2.3 ENGINE

- A. Fuel: Natural gas.
- B. Rated Engine Speed: 1800 rpm.
- C. Maximum Piston Speed for Four-Cycle Engines: 2250 fpm.

- D. Lubrication System: The following items are mounted on engine or skid:
  - 1. Filter and Strainer: Rated to remove 90 percent of particles 5 micrometers and smaller while passing full flow.
  - 2. Thermostatic Control Valve: Control flow in system to maintain optimum oil temperature. Unit shall be capable of full flow and is designed to be fail-safe.
  - 3. Crankcase Drain: Arranged for complete gravity drainage to an easily removable container with no disassembly and without use of pumps, siphons, special tools, or appliances.
- E. Engine Fuel System:
  - 1. Natural Gas System:
    - a. Carburetor.
    - b. Secondary Gas Regulators.
    - c. Fuel-Shutoff Solenoid Valves.
- F. Coolant Jacket Heater: Electric-immersion type, factory installed in coolant jacket system. Comply with NFPA 110 requirements for Level 1 equipment for heater capacity.
- G. Governor: Mechanical.
- H. Cooling System: Closed loop, liquid cooled, with radiator factory mounted on engine-generator-set mounting frame and integral engine-driven coolant pump.
  - 1. Coolant: Solution of 50 percent ethylene-glycol-based antifreeze and 50 percent water, with anticorrosion additives as recommended by engine manufacturer.
  - 2. Size of Radiator: Adequate to contain expansion of total system coolant from cold start to 110 percent load condition.
  - 3. Temperature Control: Self-contained, thermostatic-control valve modulates coolant flow automatically to maintain optimum constant coolant temperature as recommended by engine manufacturer.
  - 4. Coolant Hose: Flexible assembly with inside surface of nonporous rubber and outer covering of aging-, ultraviolet-, and abrasion-resistant fabric.
    - a. Rating: 50-psig (345-kPa) maximum working pressure with coolant at 180 deg F (82 deg C), and noncollapsible under vacuum.
    - b. End Fittings: Flanges or steel pipe nipples with clamps to suit piping and equipment connections.
- I. Muffler/Silencer: Critical type, sized as recommended by engine manufacturer and selected with exhaust piping system to not exceed engine manufacturer's engine backpressure requirements.
  - 1. Minimum sound attenuation of 25 dB at 500 Hz.
  - 2. Sound level measured at a distance of 10 feet from exhaust discharge after installation is complete shall be 85 dBA or less.
- J. Air-Intake Filter: Heavy-duty, engine-mounted air cleaner with replaceable dry-filter element and "blocked filter" indicator.
- K. Starting System: 12-V electric, with negative ground.

1. Components: Sized so they will not be damaged during a full engine-cranking cycle with ambient temperature at maximum specified in Part 1 "Project Conditions" Article.
2. Cranking Motor: Heavy-duty unit that automatically engages and releases from engine flywheel without binding.
3. Cranking Cycle: As required by NFPA 110 for system level specified.
4. Battery: Adequate capacity within ambient temperature range specified in Part 1 "Project Conditions" Article to provide specified cranking cycle at least twice without recharging.
5. Battery Cable: Size as recommended by engine manufacturer for cable length indicated. Include required interconnecting conductors and connection accessories.
6. Battery-Charging Alternator: Factory mounted on engine with solid-state voltage regulation and 35-A minimum continuous rating.
7. Battery Charger: Current-limiting, automatic-equalizing and float-charging type. Unit shall comply with UL 1236 and include the following features:
  - a. Operation: Equalizing-charging rate of 10 A shall be initiated automatically after battery has lost charge until an adjustable equalizing voltage is achieved at battery terminals. Unit shall then be automatically switched to a lower float-charging mode and shall continue to operate in that mode until battery is discharged again.
  - b. Automatic Temperature Compensation: Adjust float and equalize voltages for variations in ambient temperature from minus 40 deg. C to plus 60 deg. C to prevent overcharging at high temperatures and undercharging at low temperatures.
  - c. Automatic Voltage Regulation: Maintain constant output voltage regardless of input voltage variations up to plus or minus 10 percent.
  - d. Ammeter and Voltmeter: Flush mounted in door. Meters shall indicate charging rates.
  - e. Safety Functions: Sense abnormally low battery voltage and close contacts providing low battery voltage indication on control and monitoring panel. Sense high battery voltage and loss of ac input or dc output of battery charger. Either condition shall close contacts that provide a battery-charger malfunction indication at system control and monitoring panel.
  - f. Enclosure and Mounting: NEMA 250, Type 1, wall-mounted cabinet.

## 2.4 CONTROL AND MONITORING

- A. Automatic Starting System Sequence of Operation: When mode-selector switch on the control and monitoring panel is in the automatic position, remote-control contacts in one or more separate automatic transfer switches initiate starting and stopping of generator set. When mode-selector switch is switched to the on position, generator set starts. The off position of same switch initiates generator-set shutdown. When generator set is running, specified system or equipment failures or derangements automatically shut down generator set and initiate alarms. Operation of a remote emergency-stop switch also shuts down generator set.
- B. Configuration: Operating and safety indications, protective devices, basic system controls, and engine gauges shall be grouped in a common control and monitoring panel mounted on the generator set. Mounting method shall isolate the control panel from generator-set vibration.

- C. Indicating and Protective Devices and Controls: As required by NFPA 110 for Level 1 system, and the following:
  - 1. AC voltmeter.
  - 2. AC ammeter.
  - 3. AC frequency meter.
  - 4. DC voltmeter (alternator battery charging).
  - 5. Engine-coolant temperature gauge.
  - 6. Engine lubricating-oil pressure gauge.
  - 7. Running-time meter.
  - 8. Ammeter-voltmeter, phase-selector switch(es).
  - 9. Generator-voltage adjusting rheostat.
  - 10. Generator overload.
- D. Supporting Items: Include sensors, transducers, terminals, relays, and other devices and include wiring required to support specified items. Locate sensors and other supporting items on engine or generator, unless otherwise indicated.
- E. Connection to Data Link: A separate terminal block, factory wired to Form C dry contacts, for each alarm and status indication is reserved for connections for data-link transmission of indications to remote data terminals. Data system connections to terminals are covered in Division 26.
- F. Common Remote Audible Alarm: Comply with NFPA 110 requirements for Level 1 systems. Include necessary contacts and terminals in control and monitoring panel.
  - 1. Overcrank shutdown.
  - 2. Coolant low-temperature alarm.
  - 3. Control switch not in auto position.
  - 4. Battery-charger malfunction alarm.
  - 5. Battery low-voltage alarm.
- G. Remote Emergency-Stop Switch: Flush; wall mounted, unless otherwise indicated; and labeled. Push button shall be protected from accidental operation.

## 2.5 GENERATOR OVERCURRENT AND FAULT PROTECTION

- A. Generator Circuit Breaker: Molded-case, electronic-trip type; 100 percent rated; complying with UL 489.
  - 1. Tripping Characteristics: Adjustable long-time and short-time delay and instantaneous.
  - 2. Trip Settings: Selected to coordinate with generator thermal damage curve.
  - 3. Shunt Trip: Connected to trip breaker when generator set is shut down by other protective devices.
  - 4. Mounting: Adjacent to or integrated with control and monitoring panel.

- B. Ground-Fault Indication: Comply with NFPA 70, "Emergency System" signals for ground-fault. Integrate ground-fault alarm indication with other generator-set alarm indications.

## 2.6 GENERATOR, EXCITER, AND VOLTAGE REGULATOR

- A. Comply with NEMA MG 1.
- B. Drive: Generator shaft shall be directly connected to engine shaft. Exciter shall be rotated integrally with generator rotor.
- C. Electrical Insulation: Class H or Class F.
- D. Stator-Winding Leads: Brought out to terminal box to permit future reconnection for other voltages if required.
- E. Construction shall prevent mechanical, electrical, and thermal damage due to vibration, overspeed up to 125 percent of rating, and heat during operation at 110 percent of rated capacity.
- F. Enclosure: Dripproof.
- G. Instrument Transformers: Mounted within generator enclosure.
- H. Voltage Regulator: Solid-state type, separate from exciter, providing performance as specified.
  - 1. Adjusting rheostat on control and monitoring panel shall provide plus or minus 5 percent adjustment of output-voltage operating band.
- I. Windings: Two-thirds pitch stator winding and fully linked amortisseur winding.
- J. Subtransient Reactance: 12 percent, maximum.

## 2.7 OUTDOOR GENERATOR-SET ENCLOSURE

- A. Description: Vandal-resistant, weatherproof steel housing, wind resistant up to 100 mph. Multiple panels shall be lockable and provide adequate access to components requiring maintenance. Panels shall be removable by one person without tools. Instruments and control shall be mounted within enclosure.
- B. Qualifications
  - 1. The design is based on factory sound attenuated Level 2 enclosure.
- C. Enclosure color shall be as selected by the Architect from the manufacturers standard available colors. A minimum of six colors shall be available for enclosure exterior
- D. Sound Attenuation
  - 1. The enclosure shall be designed for a 25 dBA reduction at 1 meter from the enclosure.
- E. Description: Prefabricated or pre-engineered walk-in enclosure with the following features:
  - 1. Construction: Galvanized-steel, metal-clad, integral structural-steel-framed building.
  - 2. Structural Design and Anchorage: Comply with ASCE 7 for wind loads.
  - 3. Space Heater: Thermostatically controlled and sized to prevent condensation.
  - 4. Louvers: Equipped with bird screen and filter arranged to permit air circulation when engine is not running while excluding exterior dust, birds, and rodents.
  - 5. Hinged Doors: With padlocking provisions.

6. Ventilation: Louvers equipped with bird screen and filter arranged to permit air circulation while excluding exterior dust, birds, and rodents.
  7. Thermal Insulation: Manufacturer's standard materials and thickness selected in coordination with space heater to maintain winter interior temperature within operating limits required by engine-generator-set components.
  8. Muffler Location: Within enclosure.
- F. Integral Power Distribution: The enclosure shall contain a 60A, 3 phase, 208Y/120V load center with main breaker to feed all ancillary items within the enclosure. Ancillary items shall include, but not be limited to, jacket water heater, battery heater, lights, and receptacles. The enclosure shall include AC and DC lighting, duplex receptacles, unit heaters, etc. The DC lights shall have timer type switch. All devices in the enclosure, including specified generator set accessories, shall be pre-wired in EMT by enclosure manufacturer. In addition, the manufacturer shall perform the system integration of all components in the enclosure, mechanical and electrical.
- G. Engine Cooling Airflow through Enclosure: Maintain temperature rise of system components within required limits when unit operates at 110 percent of rated load for 2 hours with ambient temperature at top of range specified in system service conditions.
1. Louvers: Fixed-engine, cooling-air inlet and discharge. Storm-proof and drainable louvers prevent entry of rain and snow.
  2. Automatic Dampers: At engine cooling-air inlet and discharge. Dampers shall be closed to reduce enclosure heat loss in cold weather when unit is not operating.
- H. Interior Lights with Switch: Factory-wired, vaporproof-type fixtures within housing; arranged to illuminate controls and accessible interior. Arrange for external electrical connection.
1. AC lighting system and connection point for operation when remote source is available.
  2. DC lighting system for operation when remote source and generator are both unavailable.
- I. Convenience Outlets: Factory wired, GFCI. Arrange for external electrical connection.
- J. Where the generator entrance point is more than 12" above finished grade (or roof level) provide an access platform with stairs on both sides of the unit to access the generator enclosure. Materials shall be hot dipped galvanized. Stair and platform shall include the associated structural elements to support the stairs and platform. Coordinate support of stairs and platform with other Divisions. Provide shop drawing detailing materials and support points that are coordinated with the field conditions.

## 2.8 MOTORS

- A. General requirements for motors are specified in Division 23.
1. Motor Sizes: Minimum size as indicated. If not indicated, large enough so driven load will not require motor to operate in service factor range above 1.0.
  2. Controllers, Electrical Devices, and Wiring: Electrical devices and connections are specified in Division 26 Sections.

## 2.9 VIBRATION ISOLATION DEVICES

- A. Elastomeric Isolator Pads: Oil- and water-resistant elastomer or natural rubber, arranged in single or multiple layers, molded with a nonslip pattern and galvanized-steel baseplates of

sufficient stiffness for uniform loading over pad area, and factory cut to sizes that match requirements of supported equipment.

1. Material: Standard neoprene.

## 2.10 FINISHES

- A. Outdoor Enclosures and Components: Manufacturer's standard finish over corrosion-resistant pretreatment and compatible primer.

## 2.11 SOURCE QUALITY CONTROL

- A. Prototype Testing: Factory test engine-generator set using same engine model, constructed of identical or equivalent components and equipped with identical or equivalent accessories.

1. Tests: Comply with NFPA 110, Level 1 Energy Converters and with IEEE 115.

- B. Project-Specific Equipment Tests: Before shipment, factory test engine-generator set and other system components and accessories manufactured specifically for this Project. Perform tests at rated load and power factor. Include the following tests:

1. Test components and accessories furnished with installed unit that are not identical to those on tested prototype to demonstrate compatibility and reliability.
2. Full load run.
3. Maximum power.
4. Voltage regulation.
5. Transient and steady-state governing.
6. Single-step load pickup.
7. Safety shutdown.
8. Report factory test results within 10 days of completion of test.

## PART 3 - EXECUTION

### 3.1 EXAMINATION

- A. Examine areas, equipment bases, and conditions, with Installer present, for compliance with requirements for installation and other conditions affecting packaged engine-generator performance.
- B. Examine roughing-in of piping systems and electrical connections. Verify actual locations of connections before packaged engine-generator installation.
- C. Proceed with installation only after unsatisfactory conditions have been corrected.

### 3.2 INSTALLATION

- A. Comply with packaged engine-generator manufacturers' written installation and alignment instructions and with NFPA 110.

- B. Install packaged engine generator to provide access, without removing connections or accessories, for periodic maintenance.
- C. Install packaged engine generator with elastomeric isolator pads having a minimum deflection of 1 inch on 4-inch- high concrete base. Secure sets to anchor bolts installed in concrete bases. Concrete base construction is specified in Division 26.
- D. Install Schedule 40, black steel piping with welded joints and connect to engine muffler. Install thimble at wall. Piping shall be same diameter as muffler outlet. Flexible connectors and steel piping materials and installation requirements are specified in Division 23.
  - 1. Install condensate drain piping to muffler drain outlet full size of drain connection with a shutoff valve, stainless-steel flexible connector, and Schedule 40, black steel pipe with welded joints. Flexible connectors and piping materials and installation requirements are specified in Division 23.
- E. Electrical Wiring: Install electrical devices furnished by equipment manufacturers but not specified to be factory mounted.

### 3.3 CONNECTIONS

- A. Piping installation requirements are specified in Division 23 Sections. Drawings indicate general arrangement of piping and specialties.
- B. Connect fuel, cooling-system, and exhaust-system piping adjacent to packaged engine generator to allow service and maintenance.
- C. Connect engine exhaust pipe to engine with flexible connector.
- D. Connect fuel piping to engines with a gate valve and union and flexible connector.
- E. Tank accessories, piping, valves, and specialties for fuel systems are specified in Division 23.
  - 1. Natural-gas piping, valves, and specialties for gas distribution are specified in Division 23.
- F. Ground equipment according to Division 26.
- G. Connect wiring according to Division 26.

### 3.4 WIRING

- A. Control Wiring
  - 1. Control wiring shall be provided as follows:
    - a. Between starters, and fuel solenoid.
    - b. Between each ATS and generator start panel. Wiring shall be run in 1"C and shall not be wired in parallel to each switch but separately from each ATS to generator start panel.
    - c. To remote mounted annunciator to be located adjacent to fire alarm control panel. Provide wiring from all specified alarm and indicating points.
    - d. Other control wiring as required by manufacturers shop drawings.

- e. Where required to be annunciated on building automation system (BAS), provide wiring to junction box with terminal strip and numbered connections for all generator functions. Locate junction box in generator room for BAS contractor to connect to.

**B. Power Wiring**

- 1. Power wiring shall be provided as shown on contract drawing one lines and branch circuit power to generator as follows from local emergency/normal panel.
  - a. Electric service to weatherproof enclosure sized to manufacturers recommendations.
  - b. Fuel oil pumps and louver control system.
  - c. Heaters as specified and shown on manufacturer's shop drawings.
  - d. To generator control panel.
  - e. To and from battery charger and batteries.
  - f. Other power wiring as required by manufacturers shop drawings.

- C. Generator shall be grounded in accordance with NEC. Provide ground strap from building ground to generator frame.

**3.5 IDENTIFICATION**

- A. Identify system components according to Division 23 and Division 26.

**3.6 FIELD QUALITY CONTROL**

- A. Perform tests and inspections and prepare test reports.

- 1. Manufacturer's Field Service: Engage a factory-authorized service representative to inspect components, assemblies, and equipment installations, including connections, and to assist in testing.

- B. Tests and Inspections:

- 1. The system shall have two tests. The first test shall be a Pre-test to verify system operation prior to the acceptance test. The second test shall be the NFPA 110 acceptance test. Perform tests recommended by manufacturer and each electrical test and visual and mechanical inspection for "AC Generators and for Emergency Systems" specified in NETA Acceptance Testing Specification. Certify compliance with test parameters.
- 2. Generator Pre Testing
  - a. Pre-testing is required to prepare for the Installation Acceptance Test. Prior to scheduling the Installation Acceptance Test, a Pre-Acceptance Test of the system is performed by the contractor to verify that the system is operating properly and is ready for the Installation Acceptance Test.
  - b. Pre-Acceptance Test Procedure:

- 1) The Pre-Acceptance Test is typically performed two weeks prior to scheduling the Installation Acceptance Test.
  - 2) Verify that the generator starts and runs when normal power is shut off.
  - 3) Operate the Generator long enough to assure it is operating properly, to verify it starts and transfers load to emergency loads in less than 10 seconds, and that all connected equipment is operating properly.
  - 4) Verify that dampers open and ancillaries operate properly.
  - 5) Verify that fuel delivery system is operational and functioning as designed.
  - 6) Check and adjust equipment.
  - 7) Set and verify time delays on transfer switches.
  - 8) Correct deficiencies and verify that the system is ready for the Installation Acceptance Test.
  - 9) The Owner's representative should witness this test.
3. NFPA 110 Acceptance Tests: Perform tests required by NFPA 110 that are additional to those specified here including, but not limited to, single-step full-load pickup test.
  4. Battery Tests: Equalize charging of battery cells according to manufacturer's written instructions. Record individual cell voltages.
    - a. Measure charging voltage and voltages between available battery terminals for full-charging and float-charging conditions. Check electrolyte level and specific gravity under both conditions.
    - b. Test for contact integrity of all connectors. Perform an integrity load test and a capacity load test for the battery.
    - c. Verify acceptance of charge for each element of the battery after discharge.
    - d. Verify that measurements are within manufacturer's specifications.
  5. Battery-Charger Tests: Verify specified rates of charge for both equalizing and float-charging conditions.
  6. System Integrity Tests: Methodically verify proper installation, connection, and integrity of each element of engine-generator system before and during system operation. Check for air, exhaust, and fluid leaks.
  7. Exhaust Emissions Test: Comply with applicable government test criteria.
  8. Voltage and Frequency Transient Stability Tests: Use recording oscilloscope to measure voltage and frequency transients for 50 and 100 percent step-load increases and decreases, and verify that performance is as specified.
  9. Harmonic-Content Tests: Measure harmonic content of output voltage under 25 percent and at 100 percent of rated linear load. Verify that harmonic content is within specified limits.
  10. Noise Level Tests: Measure A-weighted level of noise emanating from generator-set installation, including engine exhaust and cooling-air intake and discharge, at four locations on the property line, and compare measured levels with required values.
- C. Coordinate tests with tests for transfer switches and run them concurrently.

- D. Test instruments shall have been calibrated within the last 12 months, traceable to standards of NIST, and adequate for making positive observation of test results. Make calibration records available for examination on request.
- E. Leak Test: After installation, charge system and test for leaks. Repair leaks and retest until no leaks exist.
- F. Operational Test: After electrical circuitry has been energized, start units to confirm proper motor rotation and unit operation.
- G. Test and adjust controls and safeties. Replace damaged and malfunctioning controls and equipment.
- H. Remove and replace malfunctioning units and retest as specified above.
- I. Retest: Correct deficiencies identified by tests and observations and retest until specified requirements are met.
- J. Report results of tests and inspections in writing. Record adjustable relay settings and measured insulation resistances, time delays, and other values and observations. Attach a label or tag to each tested component indicating satisfactory completion of tests.
- K. Infrared Scanning: After Substantial Completion, but not more than 60 days after Final Acceptance, perform an infrared scan of each power wiring termination and each bus connection. Remove all access panels so terminations and connections are accessible to portable scanner.
  - 1. Follow-up Infrared Scanning: Perform an additional follow-up infrared scan 11 months after date of Substantial Completion.
  - 2. Instrument: Use an infrared scanning device designed to measure temperature or to detect significant deviations from normal values. Provide calibration record for device.
  - 3. Record of Infrared Scanning: Prepare a certified report that identifies terminations and connections checked and that describes scanning results. Include notation of deficiencies detected, remedial action taken, and observations after remedial action.

### 3.7 DEMONSTRATION

- A. Engage a factory-authorized service representative to train Owner's maintenance personnel to adjust, operate, and maintain packaged engine generators. Refer to Division 01.

Project Location: \_\_\_\_\_

Project Description: \_\_\_\_\_

Date of Test: \_\_\_\_\_ Witnessed By: \_\_\_\_\_

**System Classification:** Emergency Standby Optional Standby  
(NEC) (NEC 700) (NEC 701) (NEC 702)

**Level:** Level 1 Level 2 Other  
(2002 NFPA 110 Paragraph 4.4)(Emergency)(Typically Standby) (Optional Standby)

**Classification:** Class 2 Class 6 Class 48 Class X  
(2002 NFPA 110 Table 4.1.a) (2 Hours) (6 Hours) (48 Hours) (Other  
Time, in hours)  
(Length of Time)

**Type:** Type 10 Type 60 Type 120 Type M  
(2002 NFPA 110 Table 4.1.b) (10 seconds) (60 seconds) (120 seconds)  
(Non-automatic) (Lights off till Lights on)

-----  
**Test Procedure:** Follow the sequence below. The sequence follows the NFPA 110 Acceptance Testing procedure outlined in Paragraph 7.13, Installation Acceptance, in the 2002 Edition of NFPA 110. The **Operational Test** is conducted **prior** to the **Full Load Test** (Load Bank Test) in accordance with NFPA 110.

***OPERATIONAL TEST: This phase of the test verifies operation of the generator start circuit, transfer switches, and verifies that all loads connected to the generator are energized. The load bank is not used for this part of the test.***

**Cold Start Condition:** The generator should not be run prior to the test on the day of the test.

**Normal Building Loads On:** Prior to starting the test, verify that normally operating building loads are connected and operating.

**At Time t = 0,** Open All Service Switches to the building.

Record the following:

**TIME DELAY ON START:**

**Seconds**

(From time t = 0, measure the time till the generator starts to crank. NFPA 110 7.13.4.1.3)

**CRANKING TIME FOR START/RUN:**

**Seconds**

(Time between engine starting to running per NFPA 110 7.13.4.1.4)

TIME TO REACH OPERATING SPEED: \_\_\_\_\_ Seconds

(From time t = 0, per NFPA 110 7.13.4.1.5)

**VOLTAGE OVERSHOOT:**

**Volts**

(Per NFPA 110, 7.13.4.1.6)

**FREQUENCY OVERSHOOT:** \_\_\_\_\_ **HZ**

(Per NFPA 110, 7.13.4.1.6)

**ATS TRANSFER TIMES**

(From Time t = 0, record the time for each ATS to transfer load to the generator. In general, it's the time from lights off until lights on. NFPA 110 7.13.4.1.7)

ATS 1: **Seconds**

ATS 2: \_\_\_\_\_ **Seconds**

ATS 3: **Seconds**

ATS 4: **Seconds**

**AT STEADY STATE**

(Record per NFPA 110 7.13.4.1.8, 9)

**Volts:** \_\_\_\_\_ VAB \_\_\_\_\_ VBC \_\_\_\_\_ VCA

\_\_\_\_\_ VAN \_\_\_\_\_ VBN \_\_\_\_\_ VCN

**Amperes:** \_\_\_\_\_ Ø A \_\_\_\_\_ Ø B \_\_\_\_\_ Ø C

**Oil Pressure:** **PSI**

Water Temperature: \_\_\_\_\_ ° F

**The Test Continues for 2 Hours:** During the two hours, the Owner's Representative will verify that all loads connected to the generator are energized. Exit lights and egress lighting will be checked for proper operation. The fire pump and elevators will be operated if connected to the generator. (NFPA 110 7.13.4.11)

[illegible]

At Time  $t = 2$  hours, **Restore Normal Power**

## ATS TRANSFER TIMES

ATS 1:                      seconds

ATS 2: seconds

ATS 3: seconds

ATS 4: **seconds**

**TIME DELAY FOR COOLDOWN:** \_\_\_\_\_ Minutes

(From time last transfer switch transfers back to normal power till generator shuts down. NFPA 110, 7.13.4.1(13). Delay should be 5 minutes minimum per NFPA 110 6.2.10 for units greater than or equal to 15KW.

### Cool Generator for 5 Minutes (NFPA 110 7.13.5)

**FULL LOAD TEST (Load Bank Test):** This phase of the test is an endurance test of the generator. Disconnect building load from generator and connect a load bank that is equal to 100% of the nameplate KW rating of the generator.

Connect Load Bank to the generator. Load Bank shall be equal to 100% of the generator rating (NFPA 110 7.13.6)

Initiate Full Load Test immediately after the 5 minute cool down that followed the Operational Test (NFPA 110 7.13.7). Apply 100% load as soon as the generator is running and stable.

Record the following:  
(NFPA 7.13.8)

**CRANKING TIME FOR START/RUN:** \_\_\_\_\_ **Seconds**  
(Time between engine starting to running)

**TIME TO REACH OPERATING SPEED:** \_\_\_\_\_ Seconds

**VOLTAGE OVERSHOOT:** \_\_\_\_\_ **Volts**

**FREQUENCY OVERSHOOT:** \_\_\_\_\_ **HZ**

Time minutes	Oil Pressure PSI	Water Temp ° F	Battery Charge Rate	Kilowatts	Amperes			Volts Line - Line			HZ

Shutdown Generator. The test is complete.

## SECTION 263600 - TRANSFER SWITCHES

### PART 1 - GENERAL

#### 1.1 RELATED DOCUMENTS

- A. Certain requirements common to all the mechanical and electrical trades (Fire Suppression, Plumbing, HVAC, Electrical, and Tele/Data) are specified in Division 20. To avoid repetition, they are not repeated in each relevant Division and Section. However, these requirements are applicable to the work of this Section and are hereby incorporated by reference.
- B. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.

#### 1.2 SUMMARY

- A. This section includes:
  - 1. Transfer switch product requirements
  - 2. General – automatic transfer switches
  - 3. Remote annunciator and control system
- B. Switch shall be rated for continuous duty and shall be inherently double throw. Switch shall be mechanically interlocked to ensure only one of two possible positions (except where delayed transition is required): normal or emergency. Automatic transfer switch shall be suitable for use with engine- or turbine-driven emergency generator or other utility source.

#### 1.3 SUBMITTALS

- A. Product Data: For each type of product indicated. Include rated capacities, weights, operating characteristics, furnished specialties, and accessories.
- B. Shop Drawings: Dimensioned plans, elevations, sections, and details showing minimum clearances, conductor entry provisions, gutter space, installed features and devices, and material lists for each switch specified.
  - 1. Single-Line Diagram: Show connections between transfer switch, power sources, and load; and show interlocking provisions for each combined transfer switch.
- C. Letter from the building automation system contractor identifying the integration protocol of either Modbus or BacNet.
- D. Qualification Data: For manufacturer.
- E. Field quality-control test reports.
- F. Operation and Maintenance Data: For each type of product to include in emergency, operation, and maintenance manuals. In addition to items specified in Division 01, include the following:
  - 1. Features and operating sequences, both automatic and manual.
  - 2. List of all factory settings of relays; provide relay-setting and calibration instructions, including software, where applicable.

#### 1.4 QUALITY ASSURANCE

- A. Manufacturer Qualifications: Maintain a service center capable of providing training, parts, and emergency maintenance repairs within a response period of less than eight hours from time of notification.
- B. The manufacturer of this equipment shall maintain a full-time "in-house" parts and service organization within 75 miles of the job site. The manufacturer of the equipment shall have a minimum of five (5) years of experience. Equipment offered by those who do not have an "in-house" parts and service organization and who depend on others to provide services, will not be considered. This supplier shall have his name, address, and telephone number clearly and visibly located on all equipment. Service shall be available on a 24-hour, 7-day week basis.
- C. The supplier of the equipment shall provide, at no additional charge, any information or supervision required for the proper installation of the equipment and training of operating personnel.
- D. Source Limitations: Obtain automatic transfer switches and remote annunciator and control panels through one source from a single manufacturer.
- E. Electrical Components, Devices, and Accessories: Listed and labeled as defined in NFPA 70, Article 100, by a testing agency acceptable to authorities having jurisdiction, and marked for intended use.
- F. Comply with NEMA ICS 1.
- G. Comply with NFPA 70.
- H. Comply with NFPA 110.
- I. Comply with UL 1008 unless requirements of these Specifications are stricter.

#### 1.5 PROJECT CONDITIONS

- A. Interruption of Existing Electrical Service: Do not interrupt electrical service to facilities occupied by Owner or others unless permitted under the following conditions and then only after arranging to provide temporary electrical service:
  - 1. Notify Owner no fewer than 14 days in advance of proposed interruption of electrical service.
  - 2. Do not proceed with interruption of electrical service without Owner's written permission.

#### 1.6 COORDINATION

- A. Coordinate size and location of concrete bases. Cast anchor-bolt inserts into bases. Concrete, reinforcement, and formwork requirements are specified in Division 03.

### PART 2 - PRODUCTS

#### 2.1 MANUFACTURERS

- A. Basis-of-Design Product: The design is based on Russelectric Inc to establish standards of quality for materials and performance. The naming of a specific manufacturer or catalog

number does not waive any requirements or performance of individual components described in the specification. The two switch types are the following:

1. Contactor Transfer Switches UL 3 Cycle Withstand and Closing Ratings:
  - a. Emerson; ASCO Power Technologies, LP., ASCO 7000 series.
  - b. Eaton Electrical Inc; Cutler-Hammer.
  - c. Russelectric, Inc., RTS Series
  - d. Or approved equal.

## 2.2 TRANSFER-SWITCH PRODUCT REQUIREMENTS

- A. Indicated Current Ratings: Apply as defined in UL 1008 for continuous loading and total system transfer, unless otherwise indicated.
- B. Tested Fault-Current Closing and Withstand Ratings: Adequate for duty imposed by protective devices at installation locations in Project under the fault conditions indicated, based on testing according to UL 1008.
  1. As a condition of approval, the manufacturer of the automatic transfer switches shall verify that their switches are listed by Underwriters Laboratories, Inc., Standard UL-1008 with 3 cycle short circuit closing and withstand as indicated in the transfer switch schedule on drawings:
  2. During the 3 cycle closing and withstand tests, there shall be no contact welding or damage. The 3 cycle tests shall be performed without the use of current limiting fuses. The test shall verify that contact separation has not occurred, and there is contact continuity across all phases. Test procedures shall be in accordance with UL-1008, and testing shall be certified by Underwriters' Laboratories, Inc.
- C. The automatic transfer switch shall be provided with a microprocessor controller. The controller shall provide for all operational functions of the ATS and shall be programmed at the factory with standard and specified options. The controller shall be provided with TCP/IP via 10/100 base-T ethernet. An external USB communication port on the controller's faceplate shall be provided for connection to a laptop.
- D. In addition to the standard control functions of the microprocessor, the controller shall be provided with a power monitor to monitor amperes, KW, PF, and provide wave form capture. The power information shall be available at the controller and through the ethernet port for remote connection to the BMS or other device.
- E. Resistance to Damage by Voltage Transients: Components shall meet or exceed voltage-surge withstand capability requirements when tested according to IEEE C62.41. Components shall meet or exceed voltage-impulse withstand test of NEMA ICS 1.
- F. Electrical Operation: Accomplish by a non-fused, momentarily energized solenoid or electric-motor-operated mechanism, mechanically and electrically interlocked in both directions.
- G. Switch Characteristics: Designed for continuous-duty repetitive transfer of full-rated current between active power sources.
  1. Switch Action: Double throw; mechanically held in both directions.
  2. Contacts: Silver composition or silver alloy for load-current switching. Conventional automatic transfer-switch units, rated 225 A and higher, shall have separate arcing contacts.

- H. Neutral Switching. Where four-pole switches are indicated, provide neutral pole switched simultaneously with phase poles.
- I. Annunciation, Control, and Programming Interface Components: Devices at transfer switches for communicating with remote programming devices, annunciators, or annunciator and control panels shall have communication capability matched with remote device.
- J. Factory Wiring: Train and bundle factory wiring and label, consistent with Shop Drawings, either by color-code or by numbered or lettered wire and cable tape markers at terminations. Color-coding and wire and cable tape markers are specified in Division 26.
  - 1. Designated Terminals: Pressure type, suitable for types and sizes of field wiring indicated.
  - 2. Power-Terminal Arrangement and Field-Wiring Space: Suitable for top, side, or bottom entrance of feeder conductors as indicated.
  - 3. Control Wiring: Equipped with lugs suitable for connection to terminal strips.
- K. Enclosures: General-purpose NEMA 250, Type 1, complying with NEMA ICS 6 and UL 508, unless otherwise indicated.

## 2.3 GENERAL - AUTOMATIC TRANSFER SWITCHES

- A. Comply with Level 1 equipment according to NFPA 110.
- B. Switching Arrangement: Double-throw type, incapable of pauses or intermediate position stops during normal functioning, unless otherwise indicated.
- C. Manual Switch Operation: Under load, with door closed and with either or both sources energized. Transfer time is same as for electrical operation.
- D. Signal-Before-Transfer Contacts: A set of normally open/normally closed dry contacts operates in advance of retransfer to normal source. Interval is adjustable from 1 to 30 seconds.
- E. Digital Communication Interface: Matched to capability of remote annunciator or annunciator and control panel.
- F. Transfer Switches Based on Molded-Case-Switch Components: Comply with NEMA AB 1, UL 489, and UL 869A.
- G. In-Phase Monitor: Factory-wired, internal relay controls transfer so it occurs only when the two sources are synchronized in phase. Relay compares phase relationship and frequency difference between normal and emergency sources and initiates transfer when both sources are within 15 electrical degrees, and only if transfer can be completed within 60 electrical degrees. Transfer is initiated only if both sources are within 2 Hz of nominal frequency and 70 percent or more of nominal voltage.
- H. Programmed Neutral Switch Position: All switches that are designated for optional standby branch shall be provided with a programmed neutral position arranged to provide a midpoint between the two working switch positions, with an intentional, time-controlled pause at midpoint during transfer. Pause is adjustable from 0.5 to 30 seconds minimum and factory set for 0.5 second, unless otherwise indicated. Time delay occurs for both transfer directions. Pause is disabled unless both sources are live. These switches shall also be capable of being shed to a center off position when signaled by a remote device.
- I. A WEB server shall be provided at the ATS for remote connection to a PC.
- J. Automatic Transfer-Switch Features (Microprocessor Based):

1. Under voltage sensing for Each Phase of Normal Source: Sense low phase-to-ground voltage on each phase. Pickup voltage shall be adjustable from 85 to 100 percent of nominal, and dropout voltage is adjustable from 75 to 98 percent of pickup value. Factory set for pickup at 90 percent and dropout at 85 percent.
2. Adjustable Time Delay: For override of normal-source voltage sensing to delay transfer and engine start signals. Adjustable from zero to six seconds, and factory set for one second.
3. Voltage/Frequency Lockout Relay: Prevent premature transfer to generator. Pickup voltage shall be adjustable from 85 to 100 percent of nominal. Factory set for pickup at 90 percent. Pickup frequency shall be adjustable from 90 to 100 percent of nominal. Factory set for pickup at 95 percent.
4. Time Delay for Retransfer to Normal Source: Adjustable from 0 to 30 minutes, and factory set for 10 minutes to automatically defeat delay on loss of voltage or sustained under voltage of emergency source, provided normal supply has been restored.
5. Test Switch: Simulate normal-source failure.
6. Switch-Position Pilot Lights: Indicate source to which load is connected.
7. Source-Available Indicating Lights: Supervise sources via transfer-switch normal- and emergency-source sensing circuits.
  - a. Normal Power Supervision: Green light with nameplate engraved "Normal Source Available."
  - b. Emergency Power Supervision: Red light with nameplate engraved "Emergency Source Available."
8. Unassigned Auxiliary Contacts: Two normally open, single-pole, double-throw contacts for each switch position, rated 10 A at 240-V ac.
9. Engine Starting Contacts: One isolated and normally closed, and one isolated and normally open; rated 10 A at 32-V dc minimum.
10. Engine Shutdown Contacts: Time delay adjustable from zero to five minutes, and factory set for five minutes. Contacts shall initiate shutdown at remote engine-generator controls after retransfer of load to normal source.
11. All elevator transfer switches shall be provided with a time delay for pre-transfer signal to operate a set of contacts in advance of transfer or retransfer. These contacts shall signal the elevator controller that a transfer is about to occur. The timing function shall be field adjustable from 0 seconds to 60 minutes.
12. Engine-Generator Exerciser: Solid-state, programmable-time switch starts engine generator and transfers load to it from normal source for a preset time, then retransfers and shuts down engine after a preset cool-down period. Initiates exercise cycle at preset intervals adjustable from 7 to 30 days. Running periods are adjustable from 10 to 30 minutes. Factory settings are for 7-day exercise cycle, 20-minute running period, and 5-minute cool-down period. Exerciser features include the following:
  - a. Exerciser Transfer Selector Switch: Permits selection of exercise with and without load transfer.
  - b. Push-button programming control with digital display of settings.

- c. Integral battery operation of time switch when normal control power is not available.

## **2.4 REMOTE ANNUNCIATOR AND CONTROL SYSTEM**

- A. Functional Description: Include the following functions for indicated transfer switches:
  - 1. Indication of sources available, as defined by actual pickup and dropout settings of transfer-switch controls.
  - 2. Indication of switch position.
  - 3. Indication of switch in test mode.
  - 4. Indication of failure of digital communication link.
  - 5. Key-switch or user-code access to control functions of panel.
  - 6. Control of switch-test initiation.
  - 7. Control of switch operation in either direction.
  - 8. Control of time-delay bypass for transfer to normal source.
- B. Malfunction of annunciator, annunciation and control panel, or communication link shall not affect functions of automatic transfer switch. In the event of failure of communication link, automatic transfer switch automatically reverts to stand-alone, self-contained operation. Automatic transfer-switch sensing, controlling, or operating function shall not depend on remote panel for proper operation.
- C. Remote Annunciation and Control Panel: Solid-state components. Include the following features:
  - 1. Controls and indicating lights grouped together for each transfer switch.
  - 2. Label each indicating light control group. Indicate transfer switch it controls, location of switch, and load it serves.
  - 3. Digital Communication Capability: Matched to that of transfer switches supervised.
  - 4. Mounting: Flush, modular, steel cabinet, unless otherwise indicated.

## **2.5 ENGINE START CIRCUIT MONITORING SYSTEM**

- A. Engine start circuit monitoring system: continually monitor engine start circuit wiring between each ATS and the generator.
  - 1. Include modules at each automatic transfer switch, including existing automatic transfer switches, and at the generator.
  - 2. Generator shall automatically start upon loss of integrity of the generator start circuit.
  - 3. Indicate on remote status panel if the generator started due to loss of start circuit integrity.

## **2.6 SOURCE QUALITY CONTROL**

- A. Factory test and inspect components, assembled switches, and associated equipment. Ensure proper operation. Check transfer time and voltage, frequency, and time-delay settings for compliance with specified requirements. Perform dielectric strength test complying with NEMA ICS 1.

## **PART 3 - EXECUTION**

### **3.1 INSTALLATION**

- A. Design each fastener and support to carry load indicated by seismic requirements and according to seismic-restraint details. See Division 26.
- B. Floor-Mounting Switch: Anchor to floor by bolting.
  - 1. Concrete Bases: 4 inches high, reinforced, with chamfered edges. Extend base no more than 4 inches in all directions beyond the maximum dimensions of switch, unless otherwise indicated or unless required for seismic support. Construct concrete bases according to Division 26.
- C. Annunciator and Control Panel Mounting: Flush in wall, unless otherwise indicated.
- D. Identify components according to Division 26.
- E. Set field-adjustable intervals and delays, relays, and engine exerciser clock.

### **3.2 CONNECTIONS**

- A. Wiring to Remote Components: Match type and number of cables and conductors to control and communication requirements of transfer switches as recommended by manufacturer. Increase raceway sizes at no additional cost to Owner if necessary to accommodate required wiring.
- B. Ground equipment according to Division 26.
- C. Connect wiring according to Division 26.

### **3.3 FIELD QUALITY CONTROL**

- A. Perform tests and inspections and prepare test reports.
  - 1. Manufacturer's Field Service: Engage a factory-authorized service representative to inspect components, assemblies, and equipment installation, including connections, and to assist in testing.
  - 2. After installing equipment and after electrical circuitry has been energized, test for compliance with requirements.
  - 3. Perform each visual and mechanical inspection and electrical test stated in NETA Acceptance Testing Specification. Certify compliance with test parameters.
  - 4. Measure insulation resistance phase-to-phase and phase-to-ground with insulation-resistance tester. Include external annunciation and control circuits. Use test voltages and procedure recommended by manufacturer. Comply with manufacturer's specified minimum resistance.
    - a. Check for electrical continuity of circuits and for short circuits.
    - b. Inspect for physical damage, proper installation and connection, and integrity of barriers, covers, and safety features.
    - c. Verify that manual transfer warnings are properly placed.
    - d. Perform manual transfer operation.

5. After energizing circuits, demonstrate interlocking sequence and operational function for each switch at least three times.
  - a. Simulate power failures of normal source to automatic transfer switches and of emergency source with normal source available.
  - b. Simulate loss of phase-to-ground voltage for each phase of normal source.
  - c. Verify time-delay settings.
  - d. Verify pickup and dropout voltages by data readout or inspection of control settings.
  - e. Test bypass/isolation unit functional modes and related automatic transfer-switch operations.
  - f. Verify proper sequence and correct timing of automatic engine starting, transfer time delay, retransfer time delay on restoration of normal power, and engine cool-down and shutdown.
- B. Coordinate tests with tests of generator and run them concurrently.
- C. Report results of tests and inspections in writing. Record adjustable relay settings and measured insulation and contact resistances and time delays. Attach a label or tag to each tested component indicating satisfactory completion of tests.
- D. Remove and replace malfunctioning units and retest as specified above.
- E. Infrared Scanning: After Substantial Completion, but not more than 60 days after Final Acceptance, perform an infrared scan of each switch. Remove all access panels so joints and connections are accessible to portable scanner.
  1. Follow-up Infrared Scanning: Perform an additional follow-up infrared scan of each switch 11 months after date of Substantial Completion.
  2. Instrument: Use an infrared scanning device designed to measure temperature or to detect significant deviations from normal values. Provide calibration record for device.
  3. Record of Infrared Scanning: Prepare a certified report that identifies switches checked and that describes scanning results. Include notation of deficiencies detected, remedial action taken and observations after remedial action.

### 3.4 DEMONSTRATION

- A. Engage a factory-authorized service representative to train Owner's maintenance personnel to adjust, operate, and maintain transfer switches and related equipment as specified below. Refer to Division 01.
- B. Coordinate this training with that for generator equipment.

## **SECTION 264113 - LIGHTNING PROTECTION FOR STRUCTURES**

### **PART 1 - GENERAL**

#### **1.1 RELATED DOCUMENTS**

- A. Certain requirements common to all the mechanical and electrical trades (Fire Suppression, Plumbing, HVAC, Electrical, and Tele/Data) are specified in Division 20. To avoid repetition, they are not repeated in each relevant Division and Section. However, these requirements are applicable to the work of this Section and are hereby incorporated by reference.
- B. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.

#### **1.2 SUMMARY**

- A. Section includes lightning protection for structures.

#### **1.3 SUBMITTALS**

- A. Product Data: For each type of product indicated.
- B. Shop Drawings: For air terminals and mounting accessories.
  - 1. Layout of the lightning protection system, along with details of the components to be used in the installation.
  - 2. Include indications for use of raceway, data on how concealment requirements will be met, and calculations required by NFPA 780 for bonding of grounded and isolated metal bodies.
- C. Qualification Data: For qualified Installer and manufacturer. Include data on listing or certification by UL.
- D. Certification, signed by Contractor, that roof adhesive is approved by manufacturer of roofing material.
- E. Field quality-control reports.
- F. Comply with recommendations in NFPA 780, Annex D, "Inspection and Maintenance of Lightning Protection Systems," for maintenance of the lightning protection system.
- G. Other Informational Submittals: Plans showing dimensioned as-built locations of grounding features, including the following:
  - 1. Ground rods.
  - 2. Ground loop conductor.

#### **1.4 QUALITY ASSURANCE**

- A. Installer Qualifications: Certified by UL, trained and approved for installation of units required for this Project.
- B. System Certificate:

1. UL Master Label.
- C. Electrical Components, Devices, and Accessories: Listed and labeled as defined in NFPA 780, "Definitions" Article.

## 1.5 COORDINATION

- A. Coordinate installation of lightning protection with installation of other building systems and components, including electrical wiring, supporting structures and building materials, metal bodies requiring bonding to lightning protection components, and building finishes.
- B. Coordinate installation of air terminals attached to roof systems with roofing manufacturer and Installer.
- C. Flashings of through-roof assemblies shall comply with roofing manufacturers' specifications.

## PART 2 - PRODUCTS

### 2.1 LIGHTNING PROTECTION SYSTEM COMPONENTS

- A. Comply with UL 96 and NFPA 780.
- B. Roof-Mounted Air Terminals: NFPA 780, Class I unless otherwise indicated.
  1. Manufacturers: Subject to compliance with requirements, available manufacturers offering products that may be incorporated into the Work include, but are not limited to, the following:
    - a. VFC Lightning Protection
    - b. East Coast Lightning Equipment Inc.
    - c. ERICO International Corporation.
    - d. Heary Bros. Lightning Protection Co. Inc.
    - e. Independent Protection Co.
    - f. Preferred Lightning Protection.
    - g. Robbins Lightning, Inc.
    - h. Thompson Lightning Protection, Inc.
    - i. Or approved equal.
  2. Air Terminals More than 24 Inches Long: With brace attached to the terminal at not less than half the height of the terminal.
- C. Main and Bonding Conductors: Copper.
- D. Ground Loop Conductor: The same size and type as the main conductor except tinned.
- E. Ground Rods: Copper-clad 3/4 inch in diameter by 10 feet long.
- F. Heavy-Duty, Stack-Mounted, Lightning Protection Components: Stainless steel

## PART 3 - EXECUTION

### 3.1 INSTALLATION

- A. Install lightning protection components and systems according to UL 96A and NFPA 780.
- B. Install conductors with direct paths from air terminals to ground connections. Avoid sharp bends.
- C. Conceal the following conductors:
  - 1. System conductors.
  - 2. Down conductors.
  - 3. Interior conductors.
  - 4. Conductors within normal view of exterior locations at grade within 200 feet of building.
- D. Cable Connections: Use exothermic-welded connections for all conductor splices and connections between conductors and other components.
  - 1. Exception: In single-ply membrane roofing, exothermic-welded connections may be used only below the roof level.
- E. Air Terminals on Single-Ply Membrane Roofing: Comply with roofing membrane and adhesive manufacturer's written instructions.
- F. Do not combine materials that can form an electrolytic couple that will accelerate corrosion in the presence of moisture unless moisture is permanently excluded from junction of such materials.
- G. Use conductors with protective coatings where conditions cause deterioration or corrosion of conductors.

### 3.2 FIELD QUALITY CONTROL

- A. Notify Architect at least 48 hours in advance of inspection before concealing lightning protection components.
- B. UL Inspection: Meet requirements to obtain a UL Master Label for system.
- C. LPI System Inspection: Meet requirements to obtain an LPI System Certificate.

END OF SECTION

STRUCTURES.DOC

PROTECTION FOR

## SECTION 265100 - INTERIOR LIGHTING

### PART 1 - GENERAL

#### 1.1 RELATED DOCUMENTS

- A. Certain requirements common to all the mechanical and electrical trades (Fire Suppression, Plumbing, HVAC, Electrical, and Tele/Data) are specified in Division 20. To avoid repetition, they are not repeated in each relevant Division and Section. However, these requirements are applicable to the work of this Section and are hereby incorporated by reference.
- B. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.

#### 1.2 SUMMARY

- A. Section Includes:
  - 1. Interior lighting fixtures, lamps, and ballasts.
  - 2. Emergency lighting units.
  - 3. Exit signs.
  - 4. Lighting fixture supports.

#### 1.3 DEFINITIONS

- A. CCT: Correlated color temperature.
- B. CRI: Color-rendering index.
- C. LER: Luminaire efficacy rating.
- D. Lumen: Measured output of lamp and luminaire, or both.
- E. Luminaire: Complete lighting fixture, including ballast housing if provided.

#### 1.4 ACTION SUBMITTALS

- A. Product Data: For each type of lighting fixture, arranged in order of fixture designation. Include data on features, accessories, finishes, and the following:
  - 1. Physical description of lighting fixture including dimensions.
  - 2. Emergency lighting units including battery and charger.
  - 3. Energy-efficiency data.
  - 4. Life, output (lumens, CCT, and CRI), and energy-efficiency data for lamps.
  - 5. Photometric data and adjustment factors based on laboratory tests, complying with IESNA Lighting Measurements Testing & Calculation Guides, of each lighting fixture type. The adjustment factors shall be for lamps, ballasts, and accessories identical to those indicated for the lighting fixture as applied in this Project.
    - a. Manufacturer Certified Data: Photometric data shall be certified by a manufacturer's laboratory with a current accreditation under the National Voluntary Laboratory Accreditation Program for Energy Efficient Lighting Products.

- B. Shop Drawings: For nonstandard or custom lighting fixtures. Include plans, elevations, sections, details, and attachments to other work.
  - 1. Detail equipment assemblies and indicate dimensions, weights, loads, required clearances, method of field assembly, components, and location and size of each field connection.
  - 2. Wiring Diagrams: For power, signal, and control wiring.
- C. Installation instructions.

#### 1.5 INFORMATIONAL SUBMITTALS

- A. Coordination Drawings: Reflected ceiling plan(s) and other details, drawn to scale, on which the following items are shown and coordinated with each other, using input from installers of the items involved:
  - 1. Lighting fixtures.
  - 2. Suspended ceiling components.
  - 3. Partitions and millwork that penetrate the ceiling or extends to within 12 inches of the plane of the luminaires.
  - 4. Ceiling-mounted projectors.
  - 5. Structural members to which suspension systems for lighting fixtures will be attached.
  - 6. Other items in finished ceiling including the following:
    - a. Air outlets and inlets.
    - b. Speakers.
    - c. Sprinklers.
    - d. Smoke and fire detectors.
    - e. Occupancy sensors.
    - f. Access panels.
  - 7. Perimeter moldings.
- B. Product Certificates: For each type of ballast for bi-level and dimmer-controlled fixtures, from manufacturer.
- C. Field quality-control reports.
- D. Warranty: Sample of special warranty.

#### 1.6 CLOSEOUT SUBMITTALS

- A. Operation and Maintenance Data: For lighting equipment and fixtures to include in emergency, operation, and maintenance manuals.
  - 1. Provide a list of all lamp types used on Project; use ANSI and manufacturers' codes.

#### 1.7 MAINTENANCE MATERIAL SUBMITTALS

- A. Furnish extra materials that match products installed and that are packaged with protective covering for storage and identified with labels describing contents.

1. Plastic Diffusers and Lenses: 2 percent One for every 100 of each type and rating installed. Furnish at least one of each type.
2. Globes and Guards: One for every 20 of each type and rating installed. Furnish at least one of each type.

#### 1.8 QUALITY ASSURANCE

- A. Luminaire Photometric Data Testing Laboratory Qualifications: Provided by manufacturers' laboratories that are accredited under the National Volunteer Laboratory Accreditation Program for Energy Efficient Lighting Products.
- B. Electrical Components, Devices, and Accessories: Listed and labeled as defined in NFPA 70, by a qualified testing agency, and marked for intended location and application.
- C. Comply with NFPA 70.

#### 1.9 COORDINATION

- A. Coordinate layout and installation of lighting fixtures and suspension system with other construction that penetrates ceilings or is supported by them, including HVAC equipment, fire-suppression system, and partition assemblies.

#### 1.10 WARRANTY

- A. Special Warranty for Emergency Lighting Batteries: Manufacturer's standard form in which manufacturer of battery-powered emergency lighting unit agrees to repair or replace components of rechargeable batteries that fail in materials or workmanship within specified warranty period.
- B. Philips Bodine products are fully warranted for one, two, three or five year refer to product cutsheet. This warranty covers only properly installed Philips Bodine products used under normal conditions. For the warranty period, Philips Emergency Lighting will, at its option, repair or replace without charge a defective unit, provided it is returned to the factory transportation pre-paid and our inspection determines it to be defective under terms of warranty. Repair or replacement, as stated above, shall constitute the purchaser's exclusive warranty, which does not extend to transportation, installation, labor or any other charges; nor does it apply to any equipment of another manufacturer used in conjunction with the Philips Bodine product.
  1. Warranty Period for Emergency Lighting Unit Batteries: 10 years from date of Substantial Completion. Full warranty shall apply for first year, and prorated warranty for the remaining nine years.

### PART 2 - PRODUCTS

#### 2.1 MANUFACTURERS

- A. Products: Subject to compliance with requirements, provide product indicated on Drawings or approved equal.

#### 2.2 GENERAL REQUIREMENTS FOR LIGHTING FIXTURES AND COMPONENTS

- A. Recessed Fixtures: Comply with NEMA LE 4 for ceiling compatibility for recessed fixtures.

- B. Metal Parts: All sheet metal work shall be free of burrs, sharp corners and edges, tool marks and dents, and shall have accurate angles bent as sharp as compatible with the gauges of the required metal. All intersections and joints shall be formed true of adequate strength and structural rigidity to prevent any distortion after assembly.
- C. Sheet Metal Components: a minimum of #20 gauge (0.0359 inch) thick cold rolled sheet Steel unless otherwise indicated. Form and support to prevent warping and sagging.
- D. Doors, Frames, and Other Internal Access: Smooth operating, free of light leakage under operating conditions, and designed to permit relamping without use of tools. Designed to prevent doors, frames, lenses, diffusers, and other components from falling accidentally during relamping and when secured in operating position.
- E. All fixtures shall be completely wired at the factory.
- F. Mounting Frames and Rings: If ceiling system requires, each recessed and semi-recessed fixture shall be furnished with a mounting frame or ring compatible with the ceiling in which they are to be installed. The frames and rings shall be one piece or constructed with electrically-welded butt joints, and of sufficient size and strength to sustain the weight of the fixture.
- G. Light leaks:
  - 1. Between ceiling trims of recessed lighting equipment and the ceilings will not be accepted.
  - 2. Between lighting components within the fixtures (louvers, trims, etc) will not be accepted
  - 3. Yokes, brackets and supplementary supporting members needed to mount lighting fixtures to carrier channels or other suitable ceiling members shall be furnished and installed by the Contractor.
  - 4. Adjustable Angle Fixtures: Each lighting fixture which has a beam angle adjustment shall have reliable angle locking devices.
- H. Diffusers and Globes:
  - 1. Acrylic Lighting Diffusers: Plastic for lenses and diffusers shall be formed of colorless 100 percent virgin acrylic as manufactured by Rohm & Haas, Dupont or as acceptable. The quality of the raw material must exceed IES, SPI, and NEMA Specifications by at least 100 percent which, as a minimum standard, shall not exceed a yellowness factor of 3 after 2,000 hours of exposure in the Fade-meter or as tested by an independent test laboratory. Acrylic plastic lenses and diffusers shall be properly cast, molded or extruded as specified, and shall remain free of any dimensional instability, discoloration, embrittlement, or loss of light transmittance for at least 15 years.
    - a. Lens Thickness: At least 1/8 inch minimum unless otherwise indicated.
    - b. UV stabilized.
  - 2. Glass: Annealed crystal glass unless otherwise indicated.

## 2.3 EXIT SIGNS

- A. General Requirements for Exit Signs: Comply with UL 924; for sign colors, visibility, luminance, and lettering size, comply with authorities having jurisdiction.
- B. Internally Lighted Signs:
  - 1. Lamps for AC Operation: LEDs, 50,000 hours minimum rated lamp life.

## 2.4 EMERGENCY LIGHTING UNITS

- A. General Requirements for Emergency Lighting Units: Self-contained units complying with UL 924.
1. Battery: Sealed, maintenance-free, lead-acid type.
  2. Charger: Fully automatic, solid-state type with sealed transfer relay.
  3. Operation: Relay automatically turns lamp on when power-supply circuit voltage drops to 80 percent of nominal voltage or below. Lamp automatically disconnects from battery when voltage approaches deep-discharge level. When normal voltage is restored, relay disconnects lamps from battery, and battery is automatically recharged and floated on charger.
  4. Test Push Button: Push-to-test type, in unit housing, simulates loss of normal power and demonstrates unit operability.
  5. LED Indicator Light: Indicates normal power on. Normal glow indicates trickle charge; bright glow indicates charging at end of discharge cycle.
  6. Integral Self-Test: Factory-installed electronic device automatically initiates code-required test of unit emergency operation at required intervals. Test failure is annunciated by an integral audible alarm and a flashing red LED.

## 2.5 LED LIGHTING

- A. The LED system shall be capable of at least 8-bit control of red, green and blue LEDs to produce 16.7 million colors or more and shall be digitally driven using high-speed pulse width modulation (PWM). The LED fixture shall be operated at constant and carefully regulated current levels. LEDs shall not be overdriven beyond their specified nominal voltage and current.
- B. The LED system shall use 14-bit or greater nonlinear scaling techniques for high-resolution output. Manufacturer of LED systems shall utilize an advanced production LED binning process to maintain color consistency.
- C. The LED fixture shall be operated at constant and carefully regulated current levels. LEDs shall not be overdriven beyond their specified nominal voltage and current.
- D. High power LED fixture shall be thermally protected using one or more of the following thermal management techniques: metal core board, gap pad, and/or internal monitoring firmware.
- E. LED fixture housing shall be designed to transfer heat from the LED board to the outside environment.
- F. LED fixture manufacturer must provide fixture wattage information and not LED data.
- G. For wet and damp use, LED-based fixture itself shall be sealed, rated, and tested for appropriate environmental conditions, not accomplished by using an additional housing or enclosure.
- H. All hardwired connections to LED fixtures shall be reverse polarity protected and provide high voltage protection in the event connections are reversed or shorted during the installation process.
- I. The LED system shall be scalable, with every LED fixture/address in the system capable of being controlled by a single, centralized controller.
- J. LED fixture shall be UL listed or UL classified, CE certified. And PSA marked. LED fixture and systems shall meet RoHS (Removal of Hazardous Substances) directives. Manufacturer

shall be able to provide supporting documentation of the product meeting third party regulatory compliance as well as environmental testing results.

- K. All LED fixtures (100 percent of each lot) shall undergo a minimum eight-hour burn-in test during manufacturing.
- L. Manufacturer shall provide optical performance, polar diagrams, and relevant luminance and illuminance photometric data based on test results from an independent testing lab
- M. All LED fixtures and power/data supplies shall be provided by a single manufacturer to ensure compatibility. Manufacturer shall have at least eight years of experience designing, selling and supporting intelligent LED systems.
- N. Rated Life: LED Fixtures shall be rated for 50,000 hour minimum performance on all LED diode components.
- O. Warranty: LED Manufacturers shall provide a minimum 5 year warranty on LED components. Along with the standard warranty, if extreme color shift occurs (+1,000 Kelvin) or extreme color inconsistency develops (+/- 500 Kelvin) within the warrantee period, this shall be considered a failure and the Manufacturer shall be responsible for replacing all affected fixtures free of charge.
- P. ANSI Standards: LED fixtures shall meet ANSI Standards C78.377-2008, Specifications for the Chromaticity of Solid State Lighting Products, and C82.37-2011, Harmonic Emission Limits – Related Power Quality Requirements for Lighting.
- Q. IES LM-79 and LM-80: LED Fixtures shall be LM-79-08, Electrical and Photometric Testing of Solid-State Lighting Devices, and LM-80-08, Measuring Lumen Depreciation of LED Light Sources, tested and approved.
- R. NEMA: LED Diodes and Electronic Drivers shall comply with NEMA guideline SSL-3-2010, High-Power White LED Binning for General Illumination, and SSL-1-2010, Electronic Drivers for LED Devices, Arrays, or Systems.

## 2.6 LIGHTING FIXTURE SUPPORT COMPONENTS

- A. Comply with Division 26 for channel- and angle-iron supports and nonmetallic channel and angle supports.
- B. Single-Stem Hangers: 1/2-inch steel tubing with swivel ball fittings and ceiling canopy. Finish same as fixture.
- C. Twin-Stem Hangers: Two, 1/2-inch steel tubes with single canopy designed to mount a single fixture. Finish same as fixture.
- D. Wires: ASTM A 641/A 641M, Class 3, soft temper, zinc-coated steel, 12 gauge.
- E. Wires for Humid Spaces: ASTM A 580/A 580M, Composition 302 or 304, annealed stainless steel, 12 gauge.
- F. Rod Hangers: 3/16-inch minimum diameter, cadmium-plated, threaded steel rod.
- G. Hook Hangers: Integrated assembly matched to fixture and line voltage and equipped with threaded attachment, cord, and locking-type plug.

## PART 3 - EXECUTION

### 3.1 INSTALLATION

- A. Lighting fixtures:
  - 1. Set level, plumb, and square with ceilings and walls unless otherwise indicated.
  - 2. Install lamps in each luminaire.
- B. Temporary Lighting: If it is necessary, and approved by Architect, to use permanent luminaires for temporary lighting, install and energize the minimum number of luminaires necessary. When construction is sufficiently complete, remove the temporary luminaires, disassemble, clean thoroughly, install new lamps, and reinstall.
- C. Lay-in Ceiling Lighting Fixtures Supports: Use grid as a support element.
  - 1. Install ceiling support system rods or wires, independent of the ceiling suspension devices, for each fixture. Locate not more than 6 inches from lighting fixture corners.
  - 2. Support Clips: Fasten to lighting fixtures and to ceiling grid members at or near each fixture corner with clips that are UL listed for the application.
  - 3. Fixtures of Sizes Less Than Ceiling Grid: Install as indicated on reflected ceiling plans or center in acoustical panel, and support fixtures independently with at least two 3/4-inch metal channels spanning and secured to ceiling tees.
- D. Suspended Lighting Fixture Support:
  - 1. Pendants and Rods: Where longer than 48 inches, brace to limit swinging.
  - 2. Stem-Mounted, Single-Unit Fixtures: Suspend with twin-stem hangers.
  - 3. Continuous Rows: Use tubing or stem for wiring at one point and tubing or rod for suspension for each unit length of fixture chassis, including one at each end.
  - 4. Do not use grid as support for pendant luminaires. Connect support wires or rods to building structure.
  - 5. Linear pendants: For continuous rows longer than 60 inches, where fixture is broken in sections to allow specified row length, all suspension points for that fixture shall be perfectly aligned to avoid visible bending and misalignment along the continuous row.
- E. Connect wiring according to Division 26.

### 3.2 IDENTIFICATION

- A. Install labels with panel and circuit numbers on concealed junction and outlet boxes. Comply with requirements for identification specified in Division 26.

### 3.3 FIELD QUALITY CONTROL

- A. Test for Emergency Lighting: Interrupt power supply to demonstrate proper operation. Verify transfer from normal power to battery and retransfer to normal.
- B. Verify that self-luminous exit signs are installed according to their listing and the requirements in NFPA 101.
- C. Prepare a written report of tests, inspections, observations, and verifications indicating and interpreting results. If adjustments are made to lighting system, retest to demonstrate compliance with standards.

3.4 AIMING AND ADJUSTING

- A. Occupancy Adjustments: When requested within 3 months of date of Substantial Completion, provide on-site assistance in adjusting aimable luminaires to suit actual occupied conditions. Provide up to two visits to Project during other-than-normal occupancy hours for this purpose. Some of this work may be required after dark.
1. All adjustable lighting units shall be aimed, focused, locked, etc., by the Subcontractor under the supervision of the Lighting Consultant. The Lighting Consultant shall indicate the number of crews (foreman and apprentice) required. All aiming and adjusting shall be carried out after the entire installation is complete. All ladders, scaffolds, etc. required shall be furnished by the Contractor at the direction of the Lighting Consultant. As aiming and adjusting is completed, locking set-screws and bolts and nuts shall be tightened securely.
  2. Adjust aimable luminaires in the presence of Architect or and/or end user shall provide written instruction for aiming intent for all the adjustable fixture
  3. Adjust aimable luminaires in the presence of Architect.

END OF SECTION

H:\Y0586.00\DOC\SPEC\2025\_02-20\_IFB\265100\_INTERIOR LIGHTING.DOC

## **SECTION 265615 - SITE LIGHTING**

### **PART 1 GENERAL**

#### **1.01 SCOPE OF WORK**

- A. Exterior luminaries and accessories, underground conduit, wiring, and termination.
- B. Poles and foundations.
- C. Component installation and system testing.
- D. Removal of existing overhead wires, light fixtures, and light poles as shown on the Drawings.

#### **1.02 RELATED SECTIONS AND DOCUMENTS**

- A. Section 312000 - Earthwork
- B. Electrical Testing (See Electrical Specifications)
- C. Construction Documents

#### **1.03 REFERENCES**

- A. ANSI C78.379 - Electrical Lamps - Incandescent and High-Intensity Discharge Reflector Lamps -Classification of Beam Patterns
- B. ANSI/NFPA 70 - National Electrical Codes
- C. ANSI/IES RP-8 - Recommended Practice for Roadway Lighting
- D. ANSI/IES RP-20 - Lighting for Parking Facilities
- E. ASTM A 36 – Standard Specification for Carbon Structural Steel
- F. ASTM A 307 – Standard Specification for Carbon Steel Bolts and Studs
- G. IES Lighting Handbook - 2001 9th Edition or latest edition

#### **1.04 QUALITY ASSURANCE**

- A. Contractor to verify that all specified site lighting satisfies all applicable guidelines and regulations.
- B. Once Shop Drawings are approved all lighting is to be ordered in a timely manner. The Contractor is then to inform the Landscape Architect/Engineer immediately, in writing, the date when equipment orders are completed and delivery scheduled.

- C. The Owner reserve the right to request standard production model fixture samples for inspection and to order such tests as the Owner deems necessary to ensure compliance with these specifications and to reject those luminaries failing such tests, or those luminaries with improper or inadequate light distributions. The Owner shall be the sole judge as to acceptability.

#### **1.05 SUBMITTALS**

- A. When required by the Owner, each submittal transmitted for approval shall contain:
  - 1. Computer prepared photometric layout of the proposed lighted area, which indicates by isofootcandle readings the system performance.
  - 2. A photometric report from a national independent testing laboratory with report number, date, fixture catalog number, luminaire and lamp specifications; IES calculations, candlepower tabulations, zone lumen summary and isolux plot.
  - 3. The Underwriters Laboratory listing and file number for the specific fixture(s) to be utilized.
  - 4. Pole manufacturer AASHTO calculations indicating the pole and anchor bolts being submitted are capable of supporting the pole and fixture systems being utilized in accordance with specifications.
  - 5. Catalog cuts proving complete conformance to the specifications.

#### **1.06 SYSTEMS PERFORMANCE**

- A. All luminaries as indicated on the drawings shall be "cut-off luminaries". A "cut-off luminaire" is defined by the following limitations of light distributions:
  - 1. At any lateral angle around the luminaire, the candle power per 1000 lumens shall not exceed 25 lumens at an angle of 90 degrees above horizontal and 100 lumens at a vertical angle 80 degrees above horizontal.
- B. All site lighting shall minimize light trespass and spillover onto adjacent properties. Internal house-side shields shall be incorporated on all pole-mounted luminaries abutting adjacent properties.

#### **1.07 WARRANTY**

Provide Owner with one year warranty certificate signed by Contractor and by the company providing actual warranty labor. This certificate must be received by the Owner prior to final payment.

## **PART 2 PRODUCTS**

**AS SHOWN ON THE PLANS**

## **PART 3 EXECUTION**

### **3.01 INSTALLATION**

- A. Provide concrete base for light poles at location indicated on the construction documents and in accordance detail shown on the construction documents. The concrete strength shall be at least 5,000 psi.
- B. Install poles plumb. Provide shims or double nuts where necessary to adjust plumb. Grout around each base.
- C. Install lamps in each luminaire. Contractor shall exercise caution when handling lamps. Contractor shall avoid handling lamps without clean gloves or a protective cloth wrap.
- D. Bond luminaries, metal accessories and metal poles to branch circuit equipment grounding conductor. Provide supplementary grounding electrode at each pole.

### **3.02 FIELD QUALITY CONTROL**

- A. Operate each luminaire after installation and connection. Inspect for improper connections and operation.
- B. Measure illumination levels to verify conformance with performance requirements as specified on the construction drawings and/or local ordinances.
- C. Take measurements during the night sky, without moon or with heavy overcast clouds effectively obscuring the moon.
- D. Aim and adjust luminaire to provide illumination levels and distribution as indicated on the construction drawings or as directed.

### **3.03 CLEANING**

- A. Clean electrical parts to remove conductive and deleterious materials.
- B. Remove dirt and debris from enclosure.
- C. Clean photometric control surfaces as recommended by manufacturer.
- D. Clean finishes and touch up damage.

### **3.04 PROTECTION OF FINISHED WORK**

- A. Contractor shall protect all work while construction is in progress. Contractor is responsible for any damage incurred during construction.
- B. Relamp luminaries which have failed or been damaged during construction at substantial completion.

**3.05 TESTING**

Perform and record voltmeter measurements. In addition, provide labor, material, and energy to conduct a parking lot light test at least 30 days prior to Substantial Completion date. This test shall consist of continuous operation of fixtures and lamps for a time period of 100 hours. Contractor shall witness and certify the continuous operation and time duration of the test. At the end of the testing period, immediately request warranty parts and replace defective components at least three days prior to Substantial Completion date.

**END OF SECTION 265615**

\\langan.com\data\PAR\data2\101053201\Project Data\Specifications\FOR BID\265615 Site Lighting.docx

## SECTION 27 00 00

### GENERAL REQUIREMENTS FOR TELECOMMUNICATIONS

#### PART 1 - GENERAL

##### 1.1 STIPULATIONS:

- A. The specifications sections "General Conditions of the Construction Contract", "Special Conditions", and "Division 1 - General Requirements" form a part of this Section by this reference thereto and shall have the same force and effect as if printed herewith in full.
- B. This Section shall apply to all Divisions 26, 27, and 28 Sections of these specifications as hereinafter written.
- C. Instructions to Bidders, Bidding Forms, Forms of Agreement between Owner and Contractor, Contract Award Date, Starting and Completion Dates, Conditions of the Contract, Insurance Requirements, and other Owner Requirements will be furnished separately by Owner. These documents, as well as any addenda issued, shall form a part of these Specifications, and this contractor shall consult them in detail for instructions pertaining to this work.
- D. Each trade contractor shall receive all drawings and specification sections issued as part of the overall bid package. All contractors are to receive, review, and coordinate all of their work as shown or referenced on the other trade documents. All work shown or referenced on the other trade documents shall be included as part of the overall project scope for that particular discipline and trade.

##### 1.2 SCOPE OF WORK:

- A. These specifications and accompanying drawings are intended to cover the furnishing of all labor, material, and equipment and superintendence of the Telecommunications System.
- B. It is the intent and purpose of these specifications and accompanying drawings to cover and include each item, all materials, machinery, apparatus, and labor necessary to properly install, equip, adjust, and put into perfect operation the respective portions of the installations specified and to so interconnect the various items or sections of the work as to form a complete and properly operating whole.
- C. Any equipment, apparatus, machinery, material, and small items not mentioned in detail, and labor not hereinafter specifically mentioned, which may be found necessary to complete or perfect any portion of installation in a substantial manner, and in compliance with the requirements stated, implied, or intended in these specifications shall be furnished without extra cost. This shall include all materials, devices, or methods peculiar to the machinery, equipment, apparatus, or systems furnished and installed as part of the Telecommunications work.
- D. The term "Furnish" shall mean to obtain and supply to the job site. The term "Install" shall generally mean to fix in position and connect for use. Where language indicates that one party or trade is to "install", and another is to "connect", the term "install" shall mean only to fix in

position, and "connect" shall mean to make electrical connections to. The term "Provide" shall mean to furnish and install.

**1.3 LAWS, REGULATIONS AND CODES:**

- A. Perform all work in strict compliance with all laws, regulations, and/or codes applying, including all Federal, State and local codes and any other authority having jurisdiction. Wherever drawings or specifications conflict with such regulations they shall be made to conform, and approval of the Design Professional obtained on such changes as may be involved.
- B. All electrical and telecommunications work shall comply with the requirements of the National Electrical Code, latest revision.

**1.4 PERMITS, FEES, AND CERTIFICATES OF APPROVAL:**

- A. Unless stated otherwise in General Conditions or Division 1, obtain and pay for all permits, fees, and licenses required, including those of utilities and Agencies. Provide copies to Design Professional in the quantity requested. "Fees" shall include connection charges construction costs, and other such charges by utility companies or service providers. Ascertain such charges during bidding period and include bid price.
- B. As a prerequisite to final acceptance, supply to the Design Professional a Certificate of Inspection from an Electrical Inspection Agency acceptable to Owner and approved by the local municipality and the utility company serving the project. Certificate shall cover rough wiring, fixtures, and equipment.

**1.5 RECORD DRAWINGS:**

- A. During construction keep an accurate record of all deviations of the work as shown on the drawings and that which is actually installed.
- B. Secure from the Design Professional, a complete set of prints of the Telecommunications drawings and note changes thereon. Make a complete record in a neat and accurate manner, of all changes and revisions to original design which exist in completed work, in CAD file format.
- C. The cost of furnishing above CADD files and preparing these record drawings shall be borne by the contractor. When all revisions showing the work as finally installed are made, the corrected prints and CADD files shall be submitted for review and approval by the Design Professional.
- D. Record drawings shall be delivered to Owner within 30 days after acceptance of completed project by Owner.

**1.6 OPERATING INSTRUCTIONS:**

- A. Provide to Owner three bound copies of complete written instruction on the operation, care and maintenance of each piece of equipment and the installation as a whole. Include frequency of inspection, cleaning and adjusting and other attention as may be required in accordance with manufacturer's instructions. Material shall be manufacturer's brochures, catalog cuts, parts lists, wiring diagrams, etc. Also supply Owner with three complete sets of approved shop drawings.
- B. Furnish qualified personnel to instruct Owner's personnel in the maintenance and operation of all equipment and systems. Instructing personnel shall remain on the job continuously during working hours until such instruction is complete, but not less than 16 hours.
- C. In addition, refer to Division 1.

**1.7 CORRECTION OF WORK AFTER FINAL PAYMENT AND GUARANTEE:**

- A. This article is supplementary to Guarantee Provisions of Division 1 and General Conditions.
- B. Final payment shall not relieve the contractor of responsibility for faulty equipment, materials and workmanship, and unless otherwise specified, the contractor shall remedy any defects due thereto and pay for damage to other work resulting therefrom, which shall appear within a period of one (1) year from the date of acceptance.
- C. Include guarantees by the respective equipment manufacturers which shall be subject to the terms and time limits defined under this Article of Specifications.
- D. Guarantees furnished by Sub-contractor and/or equipment manufacturers shall be counter-signed by the related Prime Contractor for joint and/or individual responsibility for subject item.
- E. Manufacturers' equipment guarantees or warranties extending beyond the guarantee period described herein shall be transferred to Owner along with the contractor's guarantees.

**1.8 QUALITY ASSURANCE**

- A. Comply with the requirements of the following codes and/or standards:
  - 1. ANSI.
  - 2. ANSI.
  - 3. UL.
  - 4. NEMA.
  - 5. NFPA.
  - 6. NEC.
  - 7. IBC 2009.
  - 8. BICSI.
  - 9. ANSI/TIA 568-D Series.
  - 10. ANSI/TIA 569-E.
  - 11. ANSI/TIA 606-C.
  - 12. ANSI/TIA 607-D.

- B. All packaged equipment shall be independently Third Party labeled as a system for its intended use by a Nationally Recognized Testing Laboratory (NRTL) in accordance with the OSHA Federal Regulations 29CFR1910.303 and .399, as well as NFPA Pamphlet #70 and National Electric Code (NEC), Article 90-7.

## **PART 2 - MATERIALS**

### **2.1 MATERIALS AND EQUIPMENT:**

- A. All installed materials and equipment shall be new and the best of their kind and shall conform to the grade, quality and standards specified herein.
- B. Unless otherwise specifically stated, all materials and equipment offered under these specifications shall be limited to products regularly produced and recommended by the manufacturer for the service intended. This material and equipment shall have capacities and ratings sufficient to amply meet the requirements of the project. The capacities and ratings shall be in accord with engineering data or other comprehensive literature made available to the public by the manufacturer and in effect at the time of opening of bids.
- C. Equipment shall be installed in accordance with manufacturer's instructions for type and quality of each piece of equipment used. These instructions shall be obtained from the manufacturer and shall be considered part of these specifications. Type, capacity, and application of equipment shall be guaranteed suitable to operate satisfactorily. No experimental material or equipment shall be permitted.

### **2.2 WORK DESCRIPTION:**

- A. In general, the work shall consist of but not necessarily be limited to the following:
  - 1. Install Owner's pre-purchased equipment as required.
  - 2. Rough in and make final connections to equipment furnished by Owner or by other Trades.
  - 3. Installation of communications backbone cabling.
  - 4. Installation of communications horizontal cabling.
  - 5. Installation of data racks in MDF and IDF Room locations.
  - 6. Communications interface with Building Management Systems, audio visual, fire alarm, and security systems.
  - 7. Communication UL 497 bonding and grounding second level, with lightning protection.
  - 8. Outside plant low voltage service provider coordination.

### **2.3 WORK INCLUDED:**

- A. In addition to work described above under WORK DESCRIPTION, the work shall include but not necessarily be limited to the following:
  - 1. Rigging of equipment and materials related to the Telecommunications Work.
  - 2. Provide and install all telecommunications racks and cabinets.

3. Provide and install horizontal and vertical cable management.
4. Provide and install horizontal UTP cabling.
5. Provide and install backbone UTP and fiber optic cabling.
6. Provide and install grounding and bonding of all systems in accordance with National Electrical Code and ANSI/TIA-607-D Standards and Requirements
7. Provide testing of installed cabling to support telecom systems.
8. Miscellaneous steel and hangers required for support of Telecom equipment.

**2.4 CHASES AND OPENINGS:**

- A. Provide information to the appropriate trades regarding size and location of all openings and chases as required for the installation of this Telecom Work.

**2.5 CUTTING AND PATCHING:**

- A. Provide all cutting and patching required for work performed under this Contract. No holes may be cut or drilled in structural members without prior approval of Owner. Cutting shall be done by mechanics skilled in their respective trades.
- B. No cutting that may impair the strength of the building construction shall be done. No holes may be drilled in or attachments welded to the beams or other structural members without prior approval from Owner. All work shall be done by mechanics skilled in their trade.
- C. All patching shall be done in a manner to match appearances and quality of existing surfaces.
- D. Provide sleeves for conduits passing through poured concrete decks, footings, walls, etc. Cut all openings for conduits passing through precast concrete or existing concrete masonry. Such holes shall be cut with core drill or similar equipment. Sleeves shall not be cut with hammer or chisel, or with any power tool depending on impact for its cutting power.

**2.6 SUBSTITUTIONS:**

- A. Equipment may be shown or specified in several ways:
  1. Manufacturer and catalogue or model number with the words "no substitutions," "no equal," "(manufacturer) only," or words of similar respect. The contractor shall furnish the specified item.
  2. Several manufacturers and model numbers listed; or one manufacturer and model number, followed by "equals by (mfr A), (mfr B), (mfr C)," or words of similar respect.
    - a. If one of the manufacturers is listed on the drawings, that manufacturer shall be considered the basis of design. If none is so listed, the first manufacturer named in the Specification shall be considered the basis of design.
    - b. Where manufacturer's or supplier's name, style and catalog numbers are mentioned in the description of material and equipment in the specifications or on the drawings, it is to be understood that they are for the purpose of setting a standard.

- c. If the contractor elects to furnish equipment other than the basis of design, he shall verify capacities, physical size, weight, electrical requirements, methods of connection to other parts of the system, and all other relevant data.  
The contractor shall be responsible for informing the Design Professional of all changes required to other equipment, spaces, structure or systems in order to install the substituted equipment. He shall furnish all required shop drawings or sketches required for Design Professional to evaluate the required changes and shall be responsible for all costs associated with such changes, including costs of design or engineering, if such are necessary, and costs of other trades.
- 3. Where manufacturer's or supplier's names are listed in conjunction with the manufacturer or supplier that is basis of design, they are given to approve the firm name only. Equipment or material submitted by such firms must meet the detailed technical specifications written for the respective item. The contractor shall be responsible for verifying capacities, physical sizes, weights, electrical requirements, methodology for connections to other parts of the system, etc. The contractor shall furnish all required shop drawings for equipment, and for its connection and installation.
- B. If any substituted items are submitted after contracts have been awarded, and there is any question of equality of such items, samples may be required to be submitted both for the item specified and that to be substituted, or further proof of equality may be required to the entire satisfaction of the Design Professional. In no case shall additional remuneration be allowed because of the rejection of a substitute.
- C. When the equipment is relocated to a place other than that shown on the drawings, or when equipment other than that specified is used, the contractor shall pay any extra cost of required revisions such as structural steel, concrete, electrical, piping, etc.
- D. The Design Professional's costs to evaluate substitutions and to revise Drawings and Specifications because of substitutions will be paid by the contractor.

## 2.7 SHOP DRAWINGS:

- A. Refer to Division 1 and individual specification sections.
- B. Furnish shop drawings, catalog cuts, performance data and other required data to the Design Professional for approval for all material and equipment specified hereinafter. Sufficient data shall be submitted to show compliance with the requirements of the plans and specifications. All shop drawings submitted shall be first checked and corrected before submitting for approval. Approval for shop drawings by the Design Professional will not relieve the contractor from responsibility for errors or omissions therein. All such errors or omissions must be made good by the contractor irrespective of any approval by the Design Professional.
- C. The following applies to all materials and equipment being submitted for this project. Refer to the individual specification sections for additional submittal requirements.
- D. It is the responsibility of the manufacturer's representative and the installing contractor to thoroughly review all shop drawing equipment submittals and state in writing that the products meet or exceed the design specifications and design intent as indicated on the contract documents, prior to submitting them for review by the engineer.

- E. The General Contractor or Construction Manager shall review and stamp all shop drawings noting the CG/CM review process has taken place and that the shop drawings are in compliance with the design documents, prior to submitting the for review by the engineer. Any shop drawings found to not be in compliance shall be returned to the contractor stating such, with a copy of the statement (only) forwarded to the engineer.
- F. On submissions beyond the initial one, clearly identify changes made from the initial submittal other than those requested by the Design Professional will review only those changes that are requested and those identified by the contractor.
- G. The Engineer will review three submissions (one original submission and up to two revised submissions) on any single component requested for review. If the contractor and/or vendor fail to comply with the drawings, specifications, and/or review comments, and additional submissions are required, the cost for those submissions will be borne by the contractor.
- H. The design documents are based and coordinated on the scheduled manufacturers. Any substitutions of products or materials (from those approved and listed in the specifications) must be thoroughly coordinated by the submitting contractor. This includes but is not limited to power, space, structural, control and performance requirements.
- I. Shop drawings required shall include, but not necessarily be limited to, the following:
  - 1. Shop drawings, cuts and catalogue information showing appearance, dimensions, performance, weight, etc., of all equipment, fixtures, appurtenances, etc. See respective equipment or system sections for more specific requirements.
  - 2. Schedules of all materials showing type and manufacturer.
  - 3. Wiring diagrams and schematics for equipment.
  - 4. Telecommunications cabinets, racks, switchboards, panels, and other protective and distribution equipment.
  - 5. All special equipment and systems.
  - 6. Other shop drawings as may be requested.
- J. Electronic and facsimile submission of shop drawings will not be accepted as the submittal format. An advanced copy for starting the process may be E-mailed but hard copy submittals shall be submitted for actual review.
- K. Product Data: Include manufacturer's technical literature for each device. Indicate dimensions, capacities, performance characteristics, electrical characteristic, finishes for materials, and installation and startup instructions for each type of product indicated.
- L. Shop Drawings: Detail equipment assemblies and indicate dimensions, weights, loads, required clearances, method of field assembly, components, and location and size of each field connection.
  - 1. Schematic flow diagrams showing all controlled equipment and control devices.
  - 2. Wiring Diagrams: Power, signal, and control wiring. Differentiate between manufacturer-installed and field-installed wiring.
  - 3. Details of control panel faces, including controls, instruments, and labeling.
  - 4. Written description of sequence of operation.
  - 5. Trunk cable schematic showing programmable control unit locations and trunk data conductors.

6. Listing of connected data points, including connected control unit and input device.
  7. System graphics indicating monitored systems, data (connected and cSMSulated) point addresses, and operator notations.
  8. System configuration showing peripheral devices, batteries, power supplies, diagrams, modems, and interconnections.
- M. Shop Drawings shall be submitted and shall consist of a complete list of equipment and materials, including manufacturer's descriptive and technical literature, catalog cuts, and installation instructions. Shop drawings shall also contain complete wiring, routing, schematic diagrams, tag number of devices, software descriptions, calculations, and any other details required to demonstrate that the system will function properly. Drawings shall show proposed layout and installation of all equipment and the relationship to other parts of the work.
- N. Shop Drawings shall be approved before any equipment is installed. Therefore, shop drawings must be submitted in time for review so that all installations can be completed per the project completion schedule. Ten working days shall be allowed for submittals to be reviewed.
- O. All drawings shall be reviewed after the final system checkout and updated or corrected to provide "as-built" drawings to show exact installation. All shop drawings will be acknowledged in writing before installation is started and again after the final checkout of the system. The system will not be considered complete until the "as-built" drawings have received their final approval. The contractor shall deliver a complete set of "as-built" drawings.

**Shop Drawing Review Comment Definitions:**

**A> No Exception Taken:**

The shop drawing or equipment submittal as submitted is approved without exception. No changes or corrections required. The materials, equipment or system submitted can be released for fabrication and construction. No Further Submission Required

**B> Make Corrections Noted:**

The shop drawing or equipment submittal as submitted is not completely correct but is approved as noted. Make the corrections noted on the shop drawing or submittal. The materials, equipment or system submitted can be released for fabrication and construction once the corrections have been made. The submittal must be corrected and resubmitted for record unless noted by "E: Resubmit". See "E: Resubmit definition below.

**C> Submit Specified Item:**

The shop drawing or equipment submittal as submitted is missing a component of the system that it represents or is not of the approved and specified manufacturers. Submit the missing or incorrect item. The materials, equipment or system submitted cannot be released for fabrication and construction.

**D> No Further Submission Required:**

The shop drawing or equipment submittal as submitted is approved as noted. No changes or corrections required. The materials, equipment or system submitted can be released for fabrication and construction. No Further Submission Required.

**E> Resubmit:**

The shop drawing or equipment submittal as submitted is not approved. The shop drawing or equipment submittal needs significant corrections and does require another submission to verify that the comments and changes have been incorporated. Make the corrections noted on the shop drawing or submittal. The materials, equipment or system submitted cannot be released for fabrication and construction.

**F> Rejected:**

The shop drawing or equipment submitted is not as specified or a non-approved manufacturer or product and rejected.

**G> Resubmit for Record Only:**

Make the corrections noted on the shop drawing or submittal. The shop drawing or equipment submittal as submitted is approved with minor exception. Changes or corrections are required. The materials, equipment or system submitted can be released for fabrication and construction.

**PART 3 - EXECUTION**

**3.1 VISIT TO SITE:**

- A. Before submitting bid, the contractor shall visit the site of the work and be thoroughly familiarized with the conditions affecting the work. No extra payment will be allowed on account of extra work made necessary by failure to do so.

**3.2 WORKMANSHIP:**

- A. All work shall be installed in a first class, neat and professional manner by tradespeople skilled in the trade involved. All details of the installation shall be mechanically and electrically correct. Should the Design Professional direct removal, change, or installation of any equipments or systems not installed in a neat and workmanlike manner, such charges shall be made by the Electrical Contractor at no expense to Owner.
- B. Equipment shall be installed in strict accordance with manufacturer's instructions for type and capacity of each piece of equipment used. The contractor shall obtain these instructions from the manufacturer and these instructions shall be considered part of these Specifications.
- C. Drawings and specifications have been prepared with best knowledge of conditions available at the time of design. If any obscurities or discrepancies exist, they shall be brought to the attention of the Design Professional before bids are submitted. If they are not discovered before

bids are submitted, the Design Professional shall be notified and shall render decision. This decision shall be final.

1. Drawings and Specifications are intended to be complementary; items described or shown in one but not both are to be furnished as if fully shown or described in both locations.
  2. In case of conflict between provisions of the Specifications, the more stringent requirement shall govern. Where a requirement is applied to a specific product, condition, system, or Specification Section which conflicts with a more general requirement elsewhere, the specific shall supersede the general.
- D. Drawings are generally indicative of the work to be installed, but do not indicate all conduit bends, fittings, boxes, and specialties which may be required, or the exact locations of all conduits. The contractor shall investigate structure and finish conditions affecting the work and arrange this work; accordingly, furnishing such fittings as may be required to meet such conditions. The contractor is responsible for exercising proper judgment to arrange this work and materials so as to avoid interference with other trades.
1. Riser diagrams, details, and schematics generally indicate cabling to be used in various systems involved. This information may or may not be duplicated on the plans, but equipment shown on either plans or riser diagrams and schematics shall be provided as if shown on both.
  2. All grades, elevations, dimensions, and clearances of equipment shown on drawings are approximate and shall be verified at site.
  3. Where work or equipment is referred to in singular terms, such reference shall be deemed to apply to as many items of work or equipment as required to complete entire installation.

### 3.3 FIELD MEASUREMENTS:

- A. Before ordering any material or doing any work, verify all measurements at the building and site and be responsible for the correctness of same. No extra compensation will be allowed on account of differences between actual dimensions and measurements and those indicated on the drawings. Any difference which may be found shall be submitted to the Design Professional for consideration before proceeding any further with the work.

### 3.4 DELIVERY OF EQUIPMENT:

- A. Be responsible for delivery of equipment, unload, and store in a manner not to interfere with the operation of other trades. Additional expense incurred because of equipment or material delivery delays shall be assumed by the responsible contractor.

### 3.5 PROTECTION OF WORK:

- A. All work, equipment and materials shall be protected at all times. All raceway openings shall be closed with caps or plugs during the installation. All equipment shall be tightly covered and protected against dirt, water, plaster, paint and other foreign material or mechanical injury

during entire progress of installation. Make good all damage caused either directly or indirectly by workmen employed to fulfill requirements of the Electrical Work.

**3.6 REMOVAL OF RUBBISH:**

- A. During the course of construction, periodically remove from the premises all rubbish resulting from work of this trade so as to prevent its accumulation. At the completion of the work contemplated under these Specifications remove from the building and site all rubbish and accumulated materials of whatever nature not caused by the other trades and leave work, and equipment free of all foreign matter including plaster, cement, and paint and leave in a clean, orderly, acceptable, and usable condition.

**3.7 COORDINATION WITH OTHER TRADES:**

- A. Work in conjunction with each of the other trades to facilitate proper and intelligent execution of work with minimum interference.
- B. Carefully examine all architectural and structural drawings for the building and drawings for electrical trade and mechanical trades and be responsible for the proper fitting of all material and equipment into the building as planned and without interference with other piping, ductwork, conduit, or equipment. Proper judgment shall be exercised to secure best possible headroom, door and window clearance, and space conditions throughout; to secure neat arrangement for piping, equipment, and conduit, and to overcome all local difficulties and interferences to best advantage. Approval for any and all changes to plans and specifications which may thus be incurred shall be obtained from the Design Professional before proceeding.
- C. The contractor shall prepare preliminary shop drawings suitable for use in coordinating this work with the work of other trades. The HVAC section will prepare and furnish reproducible prints at an appropriate scale with all trades indicating piping, ductwork and conduit in relation to all structural elements of the construction, including floor elevations; steel locations, size, and elevations; partitions locations; door locations and direction of swing; and all other information required to assure coordination of the electrical, sheetmetal and piping trades and fire protection in relation to the Architectural function of the project. Coordination meetings will be held under the supervision of Owner's Construction Manager and General Contractor. Each trade shall have proper representation at all coordination meetings for the purpose of detailing, on a reproducible print mentioned above, the exact location and routing of their work.
- D. After the conclusion of the coordination at the working meetings, each trade shall sign the coordinated drawing, with copies being distributed by the GC to all contractors and parties concerned, including Owner. Final shop drawings of all trades shall be in accordance with the coordinated drawing, which final shop drawings shall be submitted for final approval.
- E. If contractor installs work so as to cause interference with work of other trades, he shall make necessary changes in work to correct the condition without extra charge.
- F. Dimensional layout plans of equipment rooms shall be made showing all bases, pads and inertia blocks required for mechanical equipment. Include dimensions of bases, bolt layouts, details, etc.

- G. The contractor shall furnish all necessary templates, patterns, etc. for installing work and for purpose of making adjoining work conform, furnish setting plans, and shop details to other trades as required.

**3.8 COORDINATION OF TELECOMMUNICATIONS CHARACTERISTICS:**

- A. The contractor shall carefully examine the drawings of all other trades for equipment requiring telecommunications connection and shall ascertain that all telecom characteristics of equipment scheduled thereon matches the service available. If any discrepancies are noted, he shall immediately refer to Design Professional for resolution. If characteristics are correct, the contractor is responsible for ascertaining method of connection, "rough-in" dimensions, correct plug, and receptacle configurations, etc. While Design Professional has made every effort to provide such information as is known at time of design, the contractor shall obtain final data from shop drawings before proceeding.
- B. For all equipment of other trades which electrical characteristics are not scheduled on drawings of that trade, the contractor shall assume the responsibility of notifying the General Contractor furnishing such equipment as to the characteristics required; the contractor will be held responsible for correction of all problems arising from failure to do so.

**3.9 FIRESTOPPING:**

- A. All penetrations through fire-resistance-rated floor, fire resistance rated, floor/ceiling assemblies and roof construction and through fire-resistance-rated walls and partitions shall be fire stopped.
- B. Penetrations to be fire stopped include both empty openings and those containing cables, pipes, ducts, conduits, and any other items.
- C. Fire rating of sealed penetrations shall meet or exceed the rating of the assembly being penetrated.
- D. Materials shall be installed in accordance with manufacturer's recommendations and UL listing.

**END OF SECTION 27 00 00**

**SECTION 27 05 00**

**COMMON WORK ELEMENTS FOR COMMUNICATIONS SYSTEMS**

**PART 1 - GENERAL**

**1.1 STIPULATIONS**

- A. The specifications sections "General Conditions of the Construction Contract", "Special Conditions", and "Division 1 - General Requirements" form a part of this Section by this reference thereto and shall have the same force and effect as if printed herewith in full.
- B. Related Specification Sections:
  - 1. Division 07 – Through-penetration Firestop Systems
  - 2. Division 26 – Common Work Results for Electrical
  - 3. Division 26 – Low Voltage Electrical Power Conductors and Cables
  - 4. Division 26 – Grounding and Bonding for Electrical Systems
  - 5. Division 26 – Hangers and Supports for Electrical Systems
  - 6. Division 26 – Raceways and Boxes for Electrical Systems
  - 7. Division 26 – Identification for Electrical Systems
  - 8. Division 27 – General Requirements for Telecommunications
  - 9. Division 27 – Common Work Elements for Communications Systems
  - 10. Division 27 – Network Communications Systems
  - 11. Division 27 – Two-Way Communications System
  - 12. Division 27 – Audiovisual Systems
  - 13. Division 28 – Common Work Elements for Electronic Safety and Security
  - 14. Division 28 – Physical Electronic Safety and Security
  - 15. Division 28 – Video Surveillance System
  - 16. Division 28 – Security Communication System
- C. Reference Symbols:
  - 1. All device symbols are defined by the appropriate symbol schedule on the symbols and abbreviations sheet in the telecommunications systems drawing package. Not all device symbols as indicated may be required for the project.
  - 2. Because of the scale of the drawings, symbols are shown on drawings as close as possible to the mounting location. Contractor shall coordinate exact locations with all drawings and affected trades prior to submittal of shop drawings.
    - a. The Contractor shall coordinate exact locations with all security and telecommunications drawings and site plan drawings as well as all affected trades prior to submittal of any shop drawings.
- D. Abbreviations:
  - 1. ACR Attenuation to Crosstalk Ratio.
  - 2. ADA Americans with Disabilities Act
  - 3. ASTM American Society for Testing Materials
  - 4. ASIS Formerly the American Society for Industrial Security, now known simply as ASIS International

5. A/V Audio Visual Systems – For purposes of this specification section A/V systems shall include all Media Management, Video Broadcasting, Intercommunications (Paging/Public Address, Clock, Auxiliary Sound), Video Intercom, Emergency Communications, Mass Notification, Master Antenna (MATV) and Distance Learning Systems
6. AVI Audio Visual Systems Integrator: Shall be a qualified Contractor experienced in the installation and certification of A/V systems. The AVI Contractor shall be responsible for the design, testing, and certification of all audio/visual systems including, but not limited to: Intercommunications, TV Distribution, Audio Visual, Master Antenna and Bi-Directional Antenna systems as well as all structured cabling systems supporting these technologies.
7. BAS Building Automation System
8. BICSI Building Industry Consultant Services International - International organization whose primary objective is to enhance the reputation and skills of companies and individuals employed in the telecommunications and security industries by ensuring that current and developing standards are maintained.
9. CATV Community Antenna Television
10. CP Consolidation Point - Local Interconnection Point between horizontal cables from the building IDF/MDF rooms and horizontal cables for the furniture drops.
11. DDC Direct Digital Controller / Device Display Controller
12. DGP Data Gathering Panel – A component of the Physical Access Control System (PACS) located at each door or portal location that communicates, stores and processes information received from readers, reader modules, input modules, and output modules with the Security Management System CPU and software.
13. DMZ Demilitarized Zone – A firewall configuration for securing local area networks (LANs).
14. DP Demarcation Point - The point of interface between the Communications Networks, MATV, any Auxiliary Systems, and the associated Service Providers or Public Utilities. Also known as Entrance Facility. Shall also serve as the primary termination point for all incoming OSP cabling as well as the primary main grounding bus-bar for all communications systems. Refer to project documents for exact location and termination requirements.
15. ELFEXT Equal Level Far End Crosstalk.
16. EMI Electromagnetic interference.
17. EMT Electrical Metallic Tubing – Also known as thin-wall conduit.
18. FACP Fire Alarm Control Panel
19. FAS Fire Alarm System
20. FCC Federal Communications Commission
21. GFCI Ground fault circuit interrupter.
22. GUI Graphic User Interface – A specialized program employing graphical display maps of a facility and/or site which, also provides a manual user interface for all system functions and operations by utilizing control and annunciation icons from dedicated human machine interface terminals.
23. HMI Human/Machine Interface – A Computer-operated, video control terminal complying with FCC Part 15 CFR Title 47, Subparts A and B, and shall utilize multiple dynamic GUI based displays for annunciation and control LCD flat panel computer monitor or display screen as defined by related specification sections.

- 24. IBC International Building Code
- 25. ICT Information Communications Technology – For purposes of this specification section ICT shall include all communications systems including but not limited to all Data, Telephone, BAS, Intercommunications (Paging/Public Address), TV Distribution Systems (MATV) and Audio Visual Systems (A/V) Surveillance Systems and IP based Access Control.
- 26. ICTI Information Communications Technology Integrator – Shall be a qualified Contractor experienced in the installation and certification of all data, telecommunications. The ICTI shall be responsible for the design, testing, and certification of Data, Telephone communications systems and all structured cabling systems supporting these technologies.
- 27. IDF Intermediate Distribution Frame – The room/space that shall serve as the local termination point for all horizontal and backbone cabling. Also, shall be known as Equipment Room (ER), Horizontal Cross-Connect (HC) or Floor Distributor (FD).
- 28. IEEE Institute of Electrical and Electronics Engineers
- 29. IO I/O Input/Out – Commonly associated with dry contact relay-based digital integration.
- 30. IP Internet Protocol
- 31. IR Infrared
- 32. ISO International Organization for Standardization
- 33. LAN Local Area Network
- 34. LCD Liquid Crystal Display
- 35. LED Light-Emitting Diode
- 36. LV Low Voltage: As defined in NFPA 70 for circuits and equipment operating at less than 50 V or for remote-control and signaling power-limited circuits.
- 37. MDF Main Distribution Frame – The room/space that shall serve as the primary termination point for all backbone cabling to each IDF locations and horizontal connection point for local communication drops. May also serve as a local IDF location as well as the cross-connection and interconnection of all entrance cables from the DP for all PSTN and WAN connections. Also, shall be known as Main Cross Connect (MC), Telecommunications Room (TR) and/or Campus Distributor (CD)
- 38. M-JPEG Motion – Joint Photographic Experts Group
- 39. MPEG Moving picture experts' group
- 40. NEC National Electric Code
- 41. NEMA National Electrical Manufacturers Association
- 42. NEXT Near End Crosstalk
- 43. NFPA National Fire Protection Association
- 44. NTSC National Television System Committee.
- 45. NRTL Nationally Recognized Testing Laboratory
- 46. NVR Network Video Recorder
- 47. NVW Network Video Workstation
- 48. OTDR Optical Time Domain Reflectometer
- 49. OSP Outside Plant – All cabling associated with building services supporting the incoming service connections to Service Providers, Public Utilities, and Wide Area Networks.
- 50. PA Public Address or Building Intercommunications System.
- 51. PBB Telecommunications Primary Bonding Busbar
- 52. POTS Plain Old Telephone Service – Analog Telephone Circuit used for the connection of fax machines, BAS and FAS communications devices and

- shall be wired upstream of the facility's telephone switch.
- 53. PSP Physical Security Professional as registered by the American Society of Industrial Security-International (ASIS)
  - 54. PSTN Public Switched Telephone Network – Connection to local telephone utility providing local telephony communications service.
  - 55. RCDD BICSI-accredited Registered Communications Distribution Designer
  - 56. RFI Request for Information
  - 57. RGS Rigid Galvanized Steel conduit – Galvanized steel tubing, with a tubing wall that is thick enough to allow it to be threaded.
  - 58. SBB Telecommunications Secondary Bonding Busbar
  - 59. TCP/IP A standard protocol stack on which the Internet and data communications networks operate.
  - 60. TIA Telecommunications Industry Association
  - 61. TVSS Transient Voltage Surge Suppressor
  - 62. UPS Uninterruptible Power Supply
  - 63. UTP Unshielded Twisted Pair
  - 64. VoIP Voice Over IP telephone Network
  - 65. VPN Virtual Private Network
  - 66. WAN Wide Area Network
  - 67. WAP Wireless Access Point
  - 68. WLAN Wireless Local Area Network

E. Definitions:

- 1. Contract Documents: The documents consisting of the Form of Agreement between Owner and Contractor, Conditions of the Contract, (General, Supplementary, and other Conditions), Drawings, Specifications and all Addenda issued prior to the execution of the Contract.
- 2. Contract Drawings: The drawings that form a part of the Contract Documents that provides the graphical representation of the project requirements intended design and/or performance criteria to be delivered by the Contractor.
- 3. Reference Drawings: A drawing and/or set of drawings produced by a proprietary supplier, manufacturer, subContractor, or fabricator included in the Contract Documents for informational purposes, providing specific information related to the installation of related appurtenances, components, devices, hardware, products, and/or systems. Reference Drawings shall also include any Contract Drawings from prior bid packages that may have pertinent information or require coordination of trades related to this contract.
- 4. Shop Drawings: A drawing and/or set of drawings produced by the Contractor, supplier, manufacturer, subContractor, or fabricator as a detailed representation of the proper installation of the related, appurtenance, component, device, hardware, product, and/or system to be delivered in conformance to the requirements of the Contract Documents.

1.2 SUMMARY

- A. This Section contains the overall requirements associated with all Division 27 and Division 28 Specification Sections, and includes the project design intent for all data, voice, and security network communication cabling and equipment related to the installation of the following systems:

- 1. Network Communications System

2. Video Surveillance System
  3. Physical Access Control System (PACS)
  4. Audiovisual System
- B. In addition, this section shall address all requirements for submittals, quality assurance, product handling, record documents, project conditions, installation, system performance, demonstrations, testing, and certifications for all scopes of work related to network communication cabling for this project scope of work. Refer to related Division 26, 27 and 28 specification sections and all contract drawings for additional information.
1. The ICTI shall have overall responsibility for all designs, equipment and all technical support related to all Division 27 scopes of work and shall ensure full coordination of all work as required to provide the following fully operational communications network in accordance with all related specification sections and contract drawings.
    - a. The ICTI shall be responsible for providing all equipment, devices, system components, final cable terminations, programming, commissioning, and testing of all network communications cabling and equipment in accordance with all related Division 27 specification sections.
    - b. All sub-Contractors shall meet the minimum technical capabilities, certifications, and licensing requirements as defined by the "Quality Assurance" chapter.
- C. The installation, performance, features, functions, software, and programming criteria as specified herein as well as all related Division 27 specification sections have been designed to offer the maximum system efficiency, ease of operation, occupant safety and the protection of equipment as recommended by Owner and Design Professional.
1. Any deviations from the specified criteria shall be documented, reviewed and agreed to in writing by Owner and the Design Professional prior to submission of bids. Refer to Division 01, and all related Division 27 specification sections for any substitutions and/or project deviation requests.
    - a. The required information shall include but not be limited to: reason for deviation, all differences in performance, operation and function from the herein specified requirements, all benefits and added features to Owner as a result of the deviations and any additional incurred costs to Owner for maintenance and long-term Ownership.
    - b. Failure to provide Owner and Design Professional with the required information shall result in any shop drawing submissions being returned for non-conformance with the contract requirements.
  2. The Contractor and all sub-Contractors for this work shall have read all of the General Conditions, Special Requirements, General Requirements and all related specification sections and in the execution of all work shall be bound by all of the conditions and requirements therein.
  3. Prior to the submission of the Bid any discrepancies or inconsistencies noted within these specifications and/or the project drawings shall be brought to the immediate attention of Owner and Design Professional.
- D. All device symbols are defined by the appropriate symbol schedules as indicated by the symbol and abbreviation drawing sheets for each discipline. The Contractor shall coordinate exact locations with all architectural, mechanical, electrical, reflected ceiling, furniture drawings and

door hardware specifications as well as all affected trades prior to submittal of bids.

1. All symbols are shown on the contract drawings as close as possible to their intended location. Contractor shall coordinate the installation of all equipment, devices, controls, components, cabling conduits/raceways and integration of other systems with all affected trades and specified system integrators. The Contractor shall document all coordination requirements at the time of shop drawing submission.
  2. Drawings for this work are diagrammatic and intended to convey the extent, general arrangement, and locations of the work. Because of the scale of the drawings, certain basic items such as access panels, conduits, cabinet sizes, penetration sleeves, pull boxes, back-boxes and junction boxes may or may not be shown on the contract drawings. Include all items where required by code and related specification sections for proper installation of all work.
- E. Where ambiguity exists between the project specifications and the contract drawings, the superior in system performance regardless of cost shall prevail and shall be delivered by the Contractor at no additional expense to the project.
- F. Project specifications and drawings may not deal individually with every part, control, device, component, or appurtenance which may be required to produce the equipment performance for the specified system and/or as required for compliance with all specified systems integration.
1. Include such items and components, as required, for complete operational systems as defined by the project documents, whether specifically indicated or not. The Contractor shall be responsible for providing conduits/raceways, cable terminations, controls, systems, equipment, materials, devices, components, electrical power, equipment racks/cabinets, software, programming, commissioning, testing and all appurtenances as well as the integration of any ancillary systems or Owner provided equipment/components/systems.
  2. Coordinate with other applicable trades in submittal of shop drawings and the installation of all systems. All shop drawings shall detail space conditions in order to accommodate other concerned trades, all equipment locations are subject to final review by Owner and Design Professional.
- G. Use of Premises
1. General: The Contractor shall have limited use of premises for construction operations only as required to meet the scope of work as delineated by the Contract Documents.
  2. The Contractor shall design, prepare, schedule, and coordinate all scopes of work without disruption of any existing system functions or the daily operation of the facility. All communications cabling and equipment shall be installed in such a manner that all new controls, equipment and/or devices shall be installed, programmed, and tested prior to switch over and/or disconnecting of any existing communications systems.
  3. The Contractor shall coordinate all installation activities so as not to disrupt the daily routines of the facility and shall include any costs related to a phased construction methodology including but not limited all necessary temporary equipment, devices, components, or systems as well as any labor costs associated with any installation, commissioning, testing demolition of any systems required to be performed after normal business hours of the facility.
    - a. Contractor shall plan, schedule, and install all communications cabling and equipment in accordance with all requirements of the project construction

schedule. Refer to related specification sections for additional information related to project scheduling and facility access.

- b. The Contractor shall coordinate all installation and demolition activities so as not to disrupt the daily routine of the facility or negatively impact the integrity of the facility's security and life safety measures.
- c. Contractor shall demolish all existing network communications systems, cabling, devices, components and/or controls not integrated with the new telecommunications system at the completion of each project phase and only after final acceptance by Owner, and the Design Professionals. The removal or demolition of all existing system devices and/or field wiring not incorporated into the new systems shall be performed in such a manner consistent with all requirements of NFPA 70.

### 1.3 REFERENCES

- A. References to industry and trade association standards as well as all building codes are minimum installation requirements. The codes, standards, and agencies listed below shall form a part of this specification section and all work shall comply with the latest adopted standards.
- B. Where the contract drawings and specifications mandate a greater requirement or performance than those specified by any of the below referenced codes and standards, the Contract Documents shall then be the governing requirements for this project. The minimum codes and standards to be applied for this project shall be the following:
  - 1. All applicable requirements of NFPA 70 "National Electrical Code" including, but not limited to:
    - a. Article 250, Grounding
    - b. Article 300, Part A. Wiring Method
    - c. Article 310, Conductors for General Wiring
    - d. Article 725, Remote Control, Signaling Circuits
    - e. Article 770, Optical Fiber Cables, and Raceways
    - f. Article 800, Communication Systems
  - 2. National Fire Protection Association:
    - a. NFPA-72: National Fire Alarm and Signaling Code
    - b. NFPA-75: Standard for the Protection of Electronic Computer/Data Processing Equipment
    - c. NFPA 90A: Standard for the Installation of Air-Conditioning and Ventilating Systems
    - d. NFPA 92A: Standard for Smoke-Control Systems
    - e. NFPA-99: Standard for Health Care Facilities
    - f. NFPA-101: Life Safety Code
    - g. NFPA-130: Standard for Fixed Guideway Transit and Passenger Rail Systems
  - 3. ANSI/TIA Compliance: Comply with the following Electronics Industries Association Standards:
    - a. ANSI/TIA-568C: "Commercial Building Telecommunication Standard"
    - b. ANSI/TIA-569: "Commercial Building Standard for Telecommunications"

- Pathways and Spaces"
  - c. ANSI/TIA-455: "FOTP-61, Measurement of Fiber or Cable Attenuation Using an OTDR"
  - d. ANSI/TIA-606: "The Administration Standard for the Telecommunications Infrastructure of Commercial Building"
  - e. ANSI/TIA-607A: "Commercial Building Grounding and Bonding Requirements for Telecommunications"
  - f. ANSI/TIA-492A: "Detail Specification for 850-nm Laser Optimized 50- $\mu$ m Core Diameter/125 $\mu$ m Cladding Diameter Class 1a Graded Index Multi-Mode Optical Fibers"
  - g. ANSI/TIA-492CAA: Detail Specification for Single-Mode Optical Fiber
4. Underwriters Laboratories, Inc.:
- a. UL 486A: "Wire connectors and soldering lugs for use with copper conductors"
  - b. UL 1449: "Transient voltage surge suppressors"
  - c. UL 1581: "Standard for Electrical Wires, Cables, and Flexible Cords"
  - d. UL 478: "Standard for Electronic Data-Processing Units and Systems"
  - e. UL 83: "Thermoplastic-Insulated Wires and Cables,"
  - f. UL 910: "Test Method for Fire and Smoke Characteristics of Cables Used in Air-Handling Spaces." Provide products which are UL-listed and labeled.
  - g. UL 1069: Hospital Signaling and Nurse Call Equipment
5. Federal Communications Commission:
- a. FCC Regulations Part 15 Title 47.
6. Institute of Electrical and Electronic Engineers (IEEE)
- a. IEEE 802.3 - "Carrier Sense Multiple Access with Collision Detection," and all applicable supplements a through af".
  - b. IEEE 802.3.u-100 - "Base T/100-Base-TX, Fast Ethernet"
  - c. IEEE 802.3.z - "Gigabit Ethernet"
  - d. IEEE 802.3.ab - "1000 Base T"
  - e. IEEE 802.3.ae - "10 Gigabit Ethernet"
  - f. IEEE 802.3.af - "Data Terminal Equipment (DTE) Power via Media Dependent Interface (MDI) that"
  - g. IEEE 802.11.ax - "Wireless Transmission Standard"
  - h. IEEE 802.11.bt - "Power over Ethernet"

- a. 21730 - Health informatics - Use of mobile wireless communication and computing technology in healthcare facilities.
8. NEMA/ICEA Compliance:
- a. WC-5 - "Thermoplastic-Insulated Wire and Cable for the Transmission and Distribution of Electrical Energy,"
  - b. WC30 - "Color Coding of Wires and Cables," pertaining to control and signal transmission media.

9. ASTM Compliance: Comply with applicable requirements of D-2219 and D-2220. Provide copper conductors with conductivity of not less than 98% at 20°C (68°F).
10. BICSI -TDMM 13th edition
11. ADA Standards for Accessible Design
12. Local Authority Having Jurisdiction
13. National Electrical Manufacturers Association (NEMA)

#### 1.4 SUBMITTALS

- A. In addition to all submittal requirements as stipulated by Division 01 specifications sections, the Contractor shall provide all shop drawing submittals in accordance with the following:
1. Owner and Design Professional approval shall be obtained for all equipment and material before delivery to the job site. Delivery, storage, or installation of equipment or material which has not had prior approval will not be permitted at the job site.
  2. All submittals shall include adequate descriptive literature, catalog cuts, shop drawings, and other data necessary for Owner to ascertain that the proposed equipment and materials comply with specification requirements. Catalog cuts submitted for approval shall be legible and clearly identify equipment being submitted.
  3. Submittals shall be provided as a complete submission; no partial submissions will be accepted. Failure to provide a complete submission shall result in all submittals being returned for resubmission.
    - a. In addition to all paper submission requirements as stipulated by Division 01 the Contractor shall also submit one complete set of electronic submittals in a PDF format.
  4. No substituted equipment shall be reviewed without prior approval in accordance with the requirements of "substitutions" under Division 1 specification section.
  5. Mark the submittals, "SUBMITTED UNDER SECTION\_\_\_\_\_."
  - a. Submittals shall be marked to show specification reference including the section and paragraph numbers.
  6. The Contractor shall schedule submittals in order to maintain the project schedule. For coordination requirements refer to Division 01 Specification Sections, which outline basic submittal requirements and coordination. All Division 01 Specification Sections requirements shall be used in conjunction with this specification section.
  7. Prior to any submission the Contractor shall be responsible for performing the following quality control items to ensure compliance with all project requirements:
    - a. Review all Shop Drawings and Product Data
    - b. Review all field measurement criteria.
    - c. Review all field construction criteria and methodologies.
    - d. Review all catalog numbers and similar data.
    - e. Review all coordination requirements of affected trades.
    - f. Review conformance to all appropriate specification sections.
  8. All shop drawings shall be prepared using computer aided design software, drawn accurately, and in accordance with Owner's Standards. The Contractor shall not reproduce the Contract Documents or copy standard information as the basis of the

technical data, hand drawn mark-ups of the original project drawings shall not be acceptable. Failure to provide a complete set of "Contractor prepared" installation drawings at the time of submittal shall result in all submittals being returned for resubmission.

9. Submission Packaging: The Contractor shall organize the submissions according to the following packaging requirements.
  - a. Electronic Copy Submission: One complete set of electronic equipment data sheets and drawings submitted in PDF format and collated in two distinct files:
    - 1) Equipment Data Sheets, equipment schedules, alarm matrixes cable termination spread sheets, and all related pertinent information.
    - 2) Drawings including all site plans, floor plans, risers, point to point wiring, grounding, installation details and mounting elevations.
  - b. Hard Copy Submission: Submit hardcopies of all shop drawings and product datasheets in accordance with the requirements the of Division 01 specifications.
10. The ICTI shall have an RCDD professional review all shop drawings related to network designs, installations, testing, certifications, and structured cabling layouts for communications systems. Failure to provide RCDD sealed shop drawings shall result in all shop drawings being returned for resubmission without any reviews taking place.
11. Owner's and the Design Professional's review of the shop drawings and/or samples does not relieve the Contractor from compliance with the requirements of the project documents. Unless the Contractor has informed Owner and the Design Professional in writing of such deviation at the time of submission, has noted the deviation on the shop drawings, and Owner and the Design Professional has given written approval of the specific deviation to the project document.
  - a. All project requirements shall stand. Owner's and the Design Professional's review does not relieve the Contractor from responsibility for any errors of omission in the submission of shop drawings and/or samples.
12. Submit all system testing, commissioning, and startup procedures to be employed. Include all estimated times for performance of all tests, all test equipment and workforce necessary for testing.
13. Submit all qualifications and certifications in accordance with the requirements as specified elsewhere in this specification section.
14. Submit project schedule outlining the time frames for all equipment with long lead times for equipment deliveries; include all system commissioning, testing, and training time expectations. Project schedule shall be submitted as CPM schedule and shall utilize a software-based project management program.

**B. Shop Drawings:**

1. All shop drawings shall include sufficient information, clearly presented, to determine full compliance with all project drawings and specifications. Include the following information as applicable for review; failure to provide all information listed below shall result in all shop drawing submittals being returned for resubmission:
  - a. All Building Floor and Site Plans.
  - b. All equipment, devices and components with manufacturer's name(s), model

- numbers,
  - c. All equipment, device and component electrical ratings and power requirements
  - d. All equipment, device, and component performance ratings.
  - e. All equipment /device cable voltage drop calculations,
  - f. All dB losses for all fiber optic devices and cabling,
  - g. All Speaker taps, voltages, and zoning.
  - h. All equipment rack/cabinet layouts and rack/cabinet sizes.
  - i. All device-mounting elevations.
  - j. All device wiring details.
  - l. All grounding and bonding connections.
  - m. Complete point-to-point-wiring diagrams for all systems. Include all equipment and wiring termination schedules and/or matrices.
2. Provide a complete set of “Contractor prepared” installation drawings. Drawings at the minimum shall consist of floor plans indicating all; passive and active electronic component locations, field devices, device identifications, distribution racks, patch panels, control panels, auxiliary control panels, power supplies, conduit, and cable requirements as well as all 120-volt electrical circuit locations and designations.
- a. Drawings shall include at the minimum the following:
    - 1) Detailed equipment layouts for all communications rooms. Coordinate all room layouts with affected trades.
    - 2) Floor plan drawings showing locations of all equipment, devices, equipment cabinets and/or rack locations. Identify type and sizes of all equipment cabinets and/or racks.
    - 3) All cable tray layouts, and conduit routing of all conduits 2 inches in diameter or greater.
    - 4) System riser diagrams and single line drawings
    - 5) Equipment wattage for each location and estimated BTU production.
    - 6) Detailed equipment layouts for all equipment consoles. Indicate all equipment locations, power connections and installation details.
    - 7) All equipment mounting hardware/brackets and installation details. Identify type size, load capacities of all mounting hardware/brackets; include all mounting and installation details, all space requirements, any special architectural modifications required.
    - 8) Outline drawings of all equipment cabinets/racks showing the relative position of all major components, all-wiring and grounding terminations. Include all panel, cabinet and/or rack dimensions.
    - 9) All grounding and bonding termination points
3. Provide a complete termination schedule of all communications device drop/outlet locations; indicate on the installation drawings all device drops/outlets’ unique identification which shall correspond with schedule and drawings.

**C. Equipment Submittals:**

- 1. Sufficient information, clearly presented, shall be included to determine compliance with drawings and specifications.
  - a. Include all equipment data sheets pertinent to equipment provided. All data sheets shall be highlighted and annotated indicating specific equipment and options

supplied. Failure to provide the proper annotation of all equipment shall result in submittals being returned for resubmission.

2. Submit complete technical data necessary to evaluate the material and equipment. Include a complete technical specification for the submitted equipment, noting differences and adherence to this Section. Failure to provide the required data will result in all submittals being returned for resubmission.
  3. Submit performance data, equipment ratings, cable requirements, control sequences, GUI based control panels, programming matrixes, logic diagrams and all other descriptive data necessary to describe the installation and operations of the system being provided. Failure to provide the required data will result in all submittals being returned for resubmission.
  4. Parts list which shall include those replacement parts recommended by the equipment manufacturer, quantity of parts, current price, and availability of each part.
- D. Maintenance and Operation Manuals: Submit in accordance with all requirements of Division 01 specification sections and as herein specified.
1. Maintenance and Operation Manuals: Submit as required for systems and equipment specified in the technical sections. Furnish in electronic format. Furnish one complete manual as specified in the technical section but in no case later than prior to performance of systems or equipment test and furnish the remaining manuals prior to contract completion.
  2. Inscribe the following identification on the cover: the words "Maintenance and Operations Manual", include the name and location of the system, equipment, building, name of Contractor, and contract number. Include in the manual the names, addresses, and telephone numbers of each subContractor installing the system or equipment and the local representatives for the system or equipment.
  3. Provide a "Table of Contents" and assemble the manual to conform to the table of contents, with tab sheets placed before instructions covering the subject. The instructions shall be legible and easily read, with large sheets of drawings folded in.
  4. Furnish (1) digital copy of all Maintenance and Operation Manuals in PDF format.
  5. The manuals shall include:
    - a. Internal and interconnecting wiring and control diagrams with data to explain detailed operation and control of the equipment.
    - b. A control sequence describing start-up, operation, and shutdown.
    - c. Description of the function of each principal item of equipment.
    - d. Installation and maintenance instructions.
    - e. Safety precautions.
    - f. Diagrams and illustrations.
    - g. Testing methods.
    - h. Performance data.
    - i. Pictorial "exploded" parts list with part numbers. Emphasis shall be placed on the use of special tools and instruments. The list shall indicate sources of supply, recommended spare parts, and name of servicing organization.
    - j. Appendix; list qualified permanent servicing organizations for support of the equipment, including addresses and certified qualifications.
  6. Approvals will be based on complete submission of manuals together with shop

drawings.

## 1.5 QUALITY ASSURANCE

- A. Integrator Qualifications: The projects' Information Communication Technology Integrator (ICTI) shall be an accredited and authorized distributor of the appropriate equipment manufacturer and shall be fully certified in the installation, testing and programming of all equipment being provided.
1. The ICTI shall be capable of providing documented successful work experience of at least three (3) facilities of equivalent size and technical requirements utilizing the proposed equipment being provided and have on staff a minimum of one full time individual that holds a current RCDD registration.
  2. Cable Installer Qualifications: The cable installation Contractor shall demonstrate not less than three (3) years' experience in the installation of structured cabling systems and shall have on staff a minimum of one full time member that holds a current BICSI level II installer credential.
    - a. NOTE: The installation of all communications cabling shall be under the direct supervision of a current BICSI level II installer who shall be knowledgeable in the following technical applications:
      - 1) The Routing and installation of shielded, unshielded, twisted pair, coaxial and fiber optic cables.
      - 2) Bonding and grounding of cable tray and equipment racks.
      - 3) Fusion splicing of fiber optic cabling.
      - 4) Testing copper conductors for electrical continuity.
      - 5) Testing and Certifying of UTP structured cabling for attenuation and worst case near end cross talk.
      - 6) Testing and Certifying of ALL fiber optic cabling employing an Optical Time Domain Reflectometer (OTDR) in accordance with TIA protocols.
      - 7) Testing and Certifying of coaxial cable networks for RF leakage
      - 8) Termination, connection, and testing of shielded and un- shielded twisted pair cable, coaxial cabling and fiber optic cabling on all specified connectors, electrical protection blocks, termination blocks and patch panels.
      - 9) Generally accepted industry standards, as well as manufacturers written installation instructions, will be used for in-process quality control and final acceptance of the work installation.
  3. Owner and the Design Professional reserve the right to require the Contractor to submit a list of installations where the products have been in operation before approval.
    - a. Experience shall be defined as the completion of the specific system being provided, with that system being successfully operated by Owner for its intended purpose for at least three (3) years.
    - b. In addition to the above, "Experience" shall also be defined as the completion of modifications and renovations to any associated system being provided in any existing occupied facility of this size and magnitude.
    - c. For each facility submit the following:
      - 1) Name and location of facility

- 2) Date of Occupancy or beneficial use by Owner
  - 3) Construction Manager or General Contractor
  - 4) Project Architect or Engineer
  - 5) Provide information on the installed locations with operational equipment.
  - 6) Registration number and expiration date of RCDD professional
  - 7) Registration number and expiration date of Level II installer.
4. Service Qualifications: The ICTI shall be a permanent service organization maintained and/or trained by the product manufacturer on the products being provided for this project.
- a. The ICTI shall be (where required) properly licensed by the governing municipality to provide the services and work for the specific system being installed. In addition, all integrators shall be capable of providing full service for the entire warranty period within an 8-hour response time upon notification of a service emergency.
- B. Manufacturer's Qualifications: The manufacturer shall regularly and presently produce, as one of the manufacturer's principal products, the equipment and materials specified for this project, and shall have manufactured the items for at least three years.
1. Product Qualification: The Manufacturer's product shall have been in satisfactory operation, on three installations of similar size and type as this project, for approximately three years.
    - a. The manufacturers shall submit the appropriate documentation certifying that the project ICTI is a qualified service provider of all manufacturers' products being provided for this project.

#### 1.6 RECORD DOCUMENTS

- A. In addition to all general provisions of the Contract, including but not limited to all; General and Supplementary Conditions, Division 01 Specification Sections include the following project requirements:
1. Provide complete set of finalized copies of record documents prior to final acceptance of the project by Owner and the Design Professional in accordance with all requirements of Division 01 specification sections. At the minimum the record documents shall contain all information, data and drawings as described in Chapter 1.4 "Submittals" of this specification section.
    - a. As-built documents shall be submitted in both paper and electronic media formats in the quantities as specified by Division 01 specification requirements.
      - 1) All electronic data sheets, control sequences, programming matrixes and other descriptive data shall be provided in PDF formatted documents.
      - 2) Copies of all current system programming and associated software shall be provided on downloadable media formatted for the use in restoration all system operations and functionality in the event of a catastrophic failure.

#### 1.7 EXTRA MATERIAL

- A. In addition to all general provisions of the Contract, including but not limited to all; General and Supplementary Conditions, Division 01 Specification Sections refer to related specification sections “Extra Material” for specific requirements.
- B. All Extra materials shall be provided at the time of final acceptance of the project and a signed packing list shall be obtained at the time of delivery. At no time is the Contractor to use the extra materials provided for this project to replace malfunctioning or damaged equipment and or components.
- C. Provide 5% of all material as “Extra Material.”

## **PART 2 – PRODUCTS**

### **2.1 MANUFACTURED PRODUCTS**

- A. Materials and equipment furnished shall be of current production by manufacturers regularly engaged in the manufacture of such items, that meet and/or exceed the specified performance and features of the equipment and/or systems and for which replacement parts shall be readily available to the system integrator and/or Owner.
  - 1. When more than one unit, device, or component of the same class of equipment is required, such units, devices or components shall be the product of a single manufacturer.
  - 2. Acceptable manufacturers for each system shall be as specified and shall be provided in full compliance with the requirements of this and all related specification sections and contract drawings.
    - a. Manufacturers listed as acceptable shall not negate the Contractors’ responsibility for providing all equipment, devices, components and/or systems, in accordance with all functions and performance requirements of the Contract Documents.
    - b. Where manufacturer and/or manufacturer model numbers reference specific system components in the related specification sections, it is to establish the performance requirements and quality of the systems and components only.
      - 1) It is in no way an inference that the referenced model numbers are the manufacturer’s current product and are the only acceptable components for this project unless specifically referenced as “no substitutions.”
    - c. The Contractor shall provide the manufacturers’ most current product that shall meet and/or exceed the specified performance and features of the equipment and/or systems.
    - d. Equivalent UL-listed equipment may be substituted for the approved manufacturers unless stipulated by other specification sections as “No Substitutions.” All substitutions shall be submitted for approval by Owner and the Design Professional in accordance with all requirements of Division 01 specification sections and Chapter 1.4 “Submittals” of this specification section.
      - 1) Where systems and/or components are referenced as “no substitutions” the specific system and/or components shall be provided.
      - 2) All substitutions shall comply with all requirements as specified above and

- all system performance standards shall be maintained.
- 3) The Contractor shall stipulate the following information impacted by such a substitution.
    - a) Any and all extensions in time impacted by the substitution.
    - b) Any changes to the architectural or structural elements to the project
    - c) Differences in operation and/or performance from intended system criteria.
  - 4) Failure to provide the required substitution information shall result in “without consideration” the immediate rejection of the substituted equipment and/or systems.
- B. Equipment Assemblies and Components:
1. Components of an assembled unit need not be products of the same manufacturer.
    - a. Manufacturers of equipment assemblies, which include components made by others, shall assume complete responsibility for the final assembled unit.
    - b. Components shall be compatible with each other and with the total assembly for the intended service.
    - c. Constituent parts which are similar shall be the product of a single manufacturer.
    - d. Factory wiring shall be identified on the equipment being furnished and on all wiring diagrams.
- C. Compatibility and Interoperability of System Components and Devices
1. Where multiple components, devices and/or systems are intended to be interconnected and components of a complete system in accordance with any related specification sections, it shall be the Contractor’s responsibility to verify interoperability and compatibility of said components, devices and/or systems in full conformance to the specified performance criteria prior to the submission of shop drawings.
  2. Where specified devices are found to be incompatible or incapable of performing as specified in a seamless manner, the Contractor shall notify the Engineer in writing prior to submission of shop drawings. Failure to properly identify such functional discrepancies shall not relieve the Contractor from providing a complete and fully functional system in accordance with the requirements of all related specification sections.
- D. Where Factory or Off-Premises Testing of any equipment, product or assembly is recommended by the product manufacturer or where specified as part of this section and/or any related specification section:
1. Owner and Design Professional shall have the option of witnessing all factory tests. The Contractor shall notify Owner and the Design Professional at a minimum of thirty (30) working days prior to the performance of any factory or off-premises tests.
    - a. Where the factory or assembly point for all off-premises testing is not within two (2) hours driving time from the project location, the system integrator shall include as part of this project all per diem costs (travel, meals, and lodging) for a minimum

of two representatives from Owner and the project Design Professional to witness all testing.

2. Provide four (4) copies of certified test reports containing all preliminary test data and testing procedures shall be furnished to Owner and the Design Professional prior to any final testing and not more than ninety (90) days after completion of any tests.
3. When equipment, product or assembly fails to meet any factory or off-premises tests, retesting of equipment, product or assembly shall be mandated, the Contractor shall be liable for all additional expenses, including all expenses incurred by Owner and the Design Professional for witnessing the retesting of any equipment, product, or assembly.

### **PART 3 – EXECUTION**

#### **3.1 EQUIPMENT PROTECTION**

- A. Protect all materials, equipment, devices, or components permanently installed and/or stored on the job site. Protect all materials, equipment, cabling, devices, or components during construction and after installation. Provide appropriate protection of all materials, equipment, components and/or devices until time of substantial completion. All materials, equipment, components and/or devices shall be protected during shipment and storage against any physical damage, dirt, moisture, cold, snow, wind, or rain:
  1. During installation, enclosures, racks/cabinets, equipment, controls, controllers, circuit protective devices, and other like items, shall be protected against entry of any foreign matter; and shall be vacuum cleaned both inside and outside before testing and operating and repainting if required.
  2. Any materials, equipment, components and/or devices, stored on site, which have been deemed by Owner or the Design Professional to exhibit any indications of damage or exposure dust or moisture shall not be installed and shall returned to the source of supply for immediate replacement.
    - a. The use of spare parts or the return of defective equipment for repair to mitigate the damage of defective materials, equipment, components and/or devices shall not be acceptable. All materials, equipment, components and/or devices shall be new and unused until final acceptance by the Design Professional.
  3. Provide and apply protective material immediately upon receiving the products and maintain throughout the construction process.
    - a. Painted surfaces shall be protected with factory installed removable heavy kraft paper, sheet vinyl or equal.
    - b. Any damaged paint on equipment and materials shall be refinished with the same quality of paint and workmanship as used by the manufacturer so repaired area is not obvious or detectable.
  4. Failure to properly protect all materials, equipment, components and/or devices prior to final acceptance shall constitute sufficient cause for rejection of materials, equipment, components and/or devices should any defects, damage or degradation in performance is observed.

- B. Seismic Performance: All equipment, bracing, and anchoring shall be rated for the seismic zone of the geographical area in which the project resides and shall withstand the effects of earthquake motion and wind forces in accordance with the current editions of the IBC and ASCE/SEI 7. Refer to Division 01 and Division 26 – Hangers and Supports for additional seismic information and requirements.
  - 1. Equipment shall include, but not be limited to, racks/cabinets, cable/basket/ladder tray, conduit, cameras, and all appurtenances.
- C. Immediately replace all malfunctioning materials, equipment, components and/or devices with new unused products up until the time the Design Professional issues final acceptance of the system. The returning of any malfunctioning equipment, devices and/or components to the manufacturer for repair and then reinstallation at the project site shall not be acceptable.
  - 1. All replacement materials, equipment, components and/or devices shall be factory new and not scavenged from the Project's spare parts inventory or factory recycled products unless expressly identified by Contractor prior to replacement and approved beforehand by the Design Professional.

### 3.2 WORK PERFORMANCE

- A. Installation, final termination, testing, start-up and commissioning of all systems, system components and cabling infrastructures shall be under the direct supervision of the appropriate system integrator. The integrator shall be an accredited and authorized distributor of the appropriate equipment manufacturer and shall be fully certified in the installation, testing, commissioning, and programming of all equipment, devices, components and/or systems being provided as part of this project.
- B. Job site safety and worker safety is the responsibility of the Contractor. Ensure that safe access and egress from all work areas is maintained during movement and installation of materials. Clean up all debris generated by installation activities. Keep all communication equipment rooms free of debris at all times.
- C. Pre-installation Conferences: Include provisions to attend all pre- installation conferences at Project site in compliance with all requirements in Division 01 specification section and as herein specified. Review methods and procedures related to installation and operations of all communications systems, including, but not limited to, the following:
  - 1. Inspect and discuss electrical and equipment roughing-in related to all communications systems as well as other preparatory work required to be performed by other trades.
  - 2. Review and discuss all work, equipment deliveries, installation procedures and related scopes as required to conform to the phased construction schedule.
  - 3. Review sequence of operations for each type of system, control, cabling and/or integration to any systems and/or equipment provided by other trades
  - 4. Review and finalize construction schedule and verify availability of materials, installation personnel, equipment, and any preparatory work by other trades needed to make progress and avoid delays.
  - 5. Review required start-up, testing, commissioning, and certifying procedures to be employed for each system and any impacts to other trades.
- D. For work on existing facilities, arrange, phase, and perform work to assure the operation of all

communications systems for other buildings and contiguous spaces at all times. Refer to Division 01 specification section for additional information.

- E. All new work shall be installed and connected to existing work neatly and carefully. Disturbed or damaged work shall be replaced or repaired to its prior conditions, as required by Division 01 specification sections.
  - F. Coordinate the installation of all cabling, conduits/raceways and cable trays and equipment with applicable trades to ensure proper operation and function of all integrated systems in accordance with all related specification sections. Refer to Division 01 specification section for additional project coordination requirements.
    - 1. Coordinate with all trades at the time of shop drawing submission detailing all space and/or room conditions. The Contractor shall coordinate with the appropriate trade all conditions impacting the installation of any system, conduit or cable tray including but not limited to all equipment locations, site conditions, ceilings, lighting fixtures, fire protection piping and ductwork layouts to the satisfaction of all concerned trades, subject to final review by the Design Professional.
      - a. Coordinate exact location of all desktop/counter/wall mounted equipment with Owner, the Design Professional, and all affected trades prior to the installation of any equipment and/or cabling.
      - b. Coordinate exact location(s) of all cable, conduits, equipment and/or devices installations with all architectural plans, site plans, reflected ceiling plans and affected trades prior to installation.
        - 1) Equipment installations requiring coordination with other trades the Contractor shall provide all templates, back- boxes and equipment anchor bolts for mounting or flush mounting preparation, (e.g., pedestals or other devices requiring mounting on walls, concrete pads, or other materials). Coordinate delivery of templates and equipment anchor bolts to preclude any delay in the construction schedule or the work of the affected trade.
      - c. If installation of equipment, devices, cabling, raceways, cable trays and/or conduit is performed prior to coordination with other trades, which interferes with work of other trades or operation and maintenance of the facility, make necessary changes to correct the condition at no additional cost to Owner.
      - d. Prior to the final programming of any systems review with Owner and the Design Professional all system features, functions, system operations, network mapping, system integrated responses and all related programming as required for the proper operation of the respective communications systems.
- 3.3 The Contractor shall maintain a complete set of current and up to date set of shop drawings and equipment submissions at the job site at all times. The Shop drawings and all other submissions shall be marked up to reflect all as-built conditions and shall be made available for review by the Design Professional at request.
- 3.4 EQUIPMENT INSTALLATION AND REQUIREMENTS
- A. All system equipment installations shall be in accordance with good engineering practices,

NEC, local building codes, and all manufacturer's requirements. Cable terminations at all equipment locations shall comply with all state and local electrical codes. All wiring shall test free from all grounds, shorts, stray voltages, and EMI.

- B. Follow manufacturers' instructions for installing, components and adjusting all equipment and cabling. Submit one (1) copy of such instructions to Owner and the Design Professional before installing any equipment. Provide an additional copy of such instructions at the equipment during any work on the equipment. Where no instructions are included with the equipment, follow accepted industry practices and workmanlike installation standards.
- C. Equipment location shall be as close as practical to locations as indicated on the contract drawings.
  - 1. Provide all equipment clearances in accordance with NEC requirements. Arrange equipment to facilitate unrestricted access for maintenance and service around all equipment, components and/or cable terminations.
- D. Inaccessible Equipment:
  - 1. Where Owner and the Design Professional determines that the Contractor has installed equipment not conveniently accessible for operation and maintenance, the equipment shall be removed and reinstalled as directed at no additional cost to the project.
    - a. "Conveniently accessible" is defined as being capable of being reached without the use of ladders, or without climbing or crawling under or over obstacles such as, but not limited to, motors, pumps, belt guards, transformers, piping, ductwork, conduit and raceways.

### 3.5 COMMUNICATIONS CABLING REQUIREMENTS

- A. Cabling shall be sized to support the appropriate communication system. All communications cable installations shall be in accordance with good engineering practices as established by the IEEE and the NEC. All cabling shall meet all state and local electrical codes.
  - 1. Contractors shall have the option to combine all cable home runs and conductors of same type and voltage "class" in accordance with NEC requirements unless specified elsewhere. Size all conduits and install all conductors in accordance with NEC requirements and manufacturers recommendations.
    - a. All communications cabling located above inaccessible ceilings, exposed ceilings, areas outside of tenant spaces shall be installed in conduit and routed to nearest cable tray or J-hook system in accessible ceiling areas.
    - b. All conduit shall run parallel and perpendicular to building column lines.
    - c. Cabling installed above hard ceiling spaces shall be installed in dedicated conduits.
    - d. No exposed cabling will be acceptable in finished or occupied spaces of the facility without approval by Owner and the Design Professional.
    - e. Any communications system cabling installed exterior to the building and/or all cabling being routed from the facility to any remote location external to the project location shall utilize OSP rated fiber optic cable installed in conduit system.

2. Do not install bruised, kinked, scored, deformed, abraded, or otherwise damaged cable. Do not splice cable between indicated terminations, taps, or junction points. Remove and discard cable where damaged during installation and replace it with new cable.
3. Ensure that all communications cabling supports (conduits, support grips, cable trays and cable termination panels) are fully installed before proceeding with cable installation.
4. At no time shall any cables be installed and left unsupported, nor shall cables be tie-wrapped to any other supporting structure in lieu of specified cable supports. Do not tie-wrap or permanently affix cable bundles to approved cable supports.
  - a. NOTE: Cable bundles shall not be cinched too tightly; all cable ties shall be hook-and-loop tie-wraps only.
5. The Contractor shall not permit any communications cabling to lie unprotected on the floor at any time. If cables must be left on any floor, protect the cables so that they may not be walked on or have any material or equipment placed or rolled on top. Replace all damaged cables from demarcation to termination point; no splicing of damaged cables shall be permitted.
6. Maintain manufacturers recommended minimum bend radii of all cabling. Do not stretch, stress, tightly coil, bend or crimp cables. The Contractor shall keep all cabling out of the way of other trades during staging of any work. The Contractor at the Contractor's expense will replace all severely stressed or damaged cables, equipment, and materials as determined by Owner and the Design Professional.

**B. Unshielded Twisted Pair (UTP) Cable**

1. Refer to specification section 271100 for material.
2. All data TCP/IP based copper network cabling shall be concealed above suspended ceilings, bundled, and independently supported to the building structure. All cabling bundles shall be plenum rated and shall not contain any AC carrying conductors or non-associated network cables.
  - a. All cabling shall be terminated onto patch panels matching the rating of the cable and installed in the 19" equipment racks/cabinets.
  - b. Copper station cabling may be run outside of conduits and above suspended ceilings only between the cable tray and the conduit wall stub-up.
  - c. All horizontal and backbone cable installed above accessible ceilings shall be installed on J-hooks, cable trays, dedicated conduits, or in cable chases and/or a combination thereof as indicated contract drawing or specified. In no case shall cable be supported on ceiling tiles, T-bars, or tie-wrapped to any conduit or pipes.
    - 1) Cables shall not be cinched too tightly; cable ties shall be hook and loop tie-wraps only. Plastic wire ties shall not be accepted on any cabling.
    - 2) Horizontal network cabling shall not exceed a maximum distance of 295 feet from the associated communications room termination point to the furthestmost work area outlet termination point.
    - 3) Cable Support: Properly secure independently to the permanent building structure where not installed in raceway. Provide J-hooks at regular intervals appropriate to the cable and wire size. See drawing details for spacing requirements.
    - 4) Cables shall not lay loose on ceiling tiles or grids. Cables must be supported

in all areas. Bridle rings and tie-wrapped supporting methods are not acceptable.

- 5) Install all cabling parallel to building lines and follow building structure. Use cable support equipment/hardware recommended by the manufacturer and/or as herein specified.
- 6) Provide all terminations, cross-connects, wire management, surge protectors, etc. For a complete and operational system.
- 7) Any copper data communications system cabling installed exterior to the building and/or all cabling being routed from the facility to any remote location external to the project location shall be outside rated (OSP), unless specified otherwise. Outside plant cable shall not extend more than fifty (50) feet into a building interior before terminating on surge protection and transitioning to indoor plenum cable.

**C. Fiber Optic Cabling**

1. Refer to specification section 271100 for material.
2. All fiber optic cabling shall be provided to meet the communications requirements for all network communications systems, at the minimum all fiber optic cabling shall be sized in accordance with the project documents.
3. All fiber optic cable connectors, terminations and patch panel ports shall be SC/APC-type.
4. All fiber optic cabling shall be a continuous segment from demarcation to termination point. Splices shall not be permitted except at transition points and for termination purposes.
5. All fiber optic cabling shall be installed above accessible ceilings wherever possible.
6. All fiber not installed in conduit or innerduct shall be supported to the building structure and shall be plenum rated armored type cabling installed on J-hooks or in cable trays or shall be standard type fiber optic cable which shall be installed in dedicated conduits.
7. Installation of all fiber optic cabling shall be in accordance with all guidelines established by the product manufacturer and all referenced industry standards.
8. Where fiber cable segments are installed in conduits, special care shall be taken to avoid damage to the cable.
  - a. While under pulling tension, the cable shall not be bent into a curve with a radius of less than twenty (20) times the cable diameter, or no less than manufacturers minimum.
  - b. Pulling tension shall not exceed manufacturer's recommended maximum tensile load. Contractor shall utilize a winch with tension control, or a "break-away" link designed to break away at or below the recommended maximum pulling tension.
  - c. Use methods and lubricating compounds on cables and wires to prevent damage to material and products during pulling-in. Provide compounds that are not injurious to the cable and wire jackets that do not harden or become adhesive.
9. J-hooks supporting fiber optic cabling shall not exceed a maximum of 2 armored fiber cables per 2" J-hook, or 4 per 4" J-hook.
10. Provide a minimum of twenty (20) feet of slack at each end of each fiber optic cable install. Slack shall be neatly bundled in a "figure-8" style loop mechanically secured independent of other systems.
11. All exterior fiber optic cabling shall be rated for exterior outside plant (OSP) applications

and installed in dedicated inner-duct conduit system and routed in the exterior conduit ducts in accordance with the requirements of the contract documents. Outside plant cable shall not extend more than fifty (50) feet into a building interior before terminating and transitioning to plenum indoor fiber optic cable.

12. Fiber optic cabling shall be provided as the primary media for any exterior network components installed remote to building, as well as all network communications links for all backbone communications.
  - a. The Contractor shall be responsible for the determination of actual segment lengths. Actual quantities will be calculated by the routing as indicated on the contract drawings and/or in the field based on existing conditions.
13. All splices shall be fusion type. Mechanical splices shall not be acceptable except for termination purposes.
14. Refer to related specification sections for additional information related to cabling types, sizes, and testing requirements.

**D. Environmental Conditions:**

1. Systems, components, devices materials and equipment shall be capable of withstanding the environmental conditions of the space without mechanical or electrical damage or degradation of operating capabilities or performance.
  - a. Interior, Controlled Environment: System components, installed in temperature-controlled interior environments shall be rated for continuous operation in ambient conditions of 2 to 50 deg C (36 to 122 deg F) dry bulb and 20 to 90 percent relative humidity, non-condensing and shall utilize NEMA 250, Type 1 enclosures.
  - b. Interior, Uncontrolled Environment: System components installed in non-temperature-controlled interior environments shall be rated for continuous operation in ambient conditions of -18 to 50 deg C (0 to 122 deg F) dry bulb and 20 to 90 percent relative humidity, non-condensing and shall utilize NEMA 250, Type 4X enclosures.
  - c. Exterior Environment: System components, conduits and back boxes installed in locations exposed to weather shall be rated for continuous operation in ambient conditions of -34 to 50 deg C (-30 to 122 deg F) dry bulb and 20 to 90 percent relative humidity, condensing. Rated for continuous operation where exposed to rain as specified in NEMA 250, winds up to 137 km/h (85 mph) and snow cover up to 610 mm (24 in) thick shall utilize NEMA 250, Type 4X enclosures.
  - d. Hazardous Environment: System components, conduits and back boxes located in areas where fire or explosion hazards may exist because of flammable gases or vapors, flammable liquids, combustible dust, or ignitable fibers shall be rated, listed, and installed according to NFPA 70.
  - e. Corrosive Environment: System components, conduits and back boxes subjected to corrosive fumes, vapors, and wind-driven salt spray in coastal zones, shall utilize NEMA 250, Type 4X enclosures.
  - f. Submersible Environment: System components, conduits and back-boxes subjected to prolonged submersion in water, shall utilize NEMA 250, Type 6P enclosures.
  - g. Areas where equipment and devices may be subject to damage by the general population shall be installed in vandal resistant enclosures; all fire alarm system and related devices shall be provided with wire guards.
  - h. Console: All console equipment shall, unless noted otherwise, be rated for

continuous operation under ambient environmental conditions of 15.6 to 29.4 deg C (60 to 85 deg F) and a relative humidity of 20 to 80 percent.

**E. Conduits/Raceway/Cable Trays:**

1. Provide conduit and raceway systems for all communications networks as indicated below. Refer to all related specification sections for additional conduit and raceway information.
  - a. Accessible suspended ceilings: Provide conduit stub-up from each outlet location to space above ceiling. All conduit stub-up shall include nylon bushing at exposed edge of conduit for protection of all cabling.
  - b. Exposed structure: Provide conduit run from each drop to a height of 12 feet to cable tray or J-hooks where provided.
  - c. Vertical Wire runway shall be installed in dedicated conduits and shall be supported any/all risers between floors in closets or accessible locations; in no case shall any cable risers be unsupported.
  - d. Cables entering all communications equipment rooms shall be supported with Cable tray from entrance to rack/cabinet location as indicated on the contract drawings and/or herein specified.
  - e. Wire basket cable tray system shall be provided in all corridors as indicated on the contract drawings and installed as herein specified.
2. All conduits/raceways shall be concealed and shall be installed above accessible finished ceilings and/or in walls. Any conduits/raceways installed in areas requiring installation to be exposed, shall be installed tight to ceilings and at right angles to walls/building lines and shall not obstruct any access hatches, equipment service panels, lighting or other equipment and/or devices. No exposed conduits/raceways shall be installed without prior approval of Owner and the Design Professional.
  - a. Where conduits cannot be concealed above ceilings or in walls and must be installed in finished or occupied areas of the building, all conduits shall be finished wire-mold type raceways or approved equal. Finished wire-mold type raceways shall not be installed without prior approval in writing by Owner and the Design Professional.
  - b. Where any equipment and/or junction boxes are installed above non-accessible finished ceilings, the Contractor shall provide access hatches listed for the intended application. Access hatches shall be located so that service access to the equipment and/or junction boxes is unimpeded.
    - 1) Access hatches shall not obstruct any equipment, service panels, lighting equipment, devices, or any architectural elements of the ceiling. At the time of submittals, the Contractor shall submit all proposed access hatch locations for review by the Design Professional.
  - c. All conduits/raceways shall be supported in accordance with NEC requirements and shall be affixed in such a manner that tampering and/or removal without the use of specialized tools shall be prevented.
  - d. All conduits/raceways shall be installed in a manner that prevents tampering or removal when installed in areas exposed to the general population.

- 1) Provide tamper-resistant installation utilizing “torx with peg” security-fastening devices for all conduits/raceways, equipment, devices, and appurtenances in all areas accessible to the general population and/or areas subjected to tampering or vandalism.
- e. Interior raceways shall be a minimum 1 inch unless otherwise noted. Exterior raceways shall be a minimum 1 1/4-inch. Size all raceways and install conductors in accordance with NEC requirements. Fill ratio shall not exceed 40 percent for indoor or exterior raceways.
  - 1) EMT conduit with compression fittings and/or MC cabling may be utilized in all inaccessible ceiling areas unless otherwise restricted by code.
  - 2) Threaded Rigid metal conduit shall be used on all exterior applications, stub-ups and all interior areas where concealed conduit requirements cannot be met and are exposed to tampering or damage by the general population.
    - a) All areas considered being of high risk due to the nature of the occupancy or the need to protect and maintain the integrity of the cabling shall be installed in rigid threaded conduits.
- f. Conduits shall be continuous. Conduit runs shall not exceed two (2) 90 degree bends and/or 100 feet without a pull/junction box.
- g. All conduits and pull/junction boxes shall be concealed in walls or ceilings unless otherwise noted.
- h. Conduits shall be connected to pull/junction boxes with set screw connectors and nylon screw on bushings.
- i. Conduit inside bend radius for 2” conduits or less shall be 6 times the internal diameter. Conduit inside bend radius for sizes over 2” shall be 10 times the internal diameter. The use of condulets (lb’s) is prohibited.
- j. Pull/junction boxes shall not be used in lieu of a bend.
- k. Firestop all annular space around conduits at through-wall and through-floor penetrations match the rating of the penetrated wall and floor.
- l. Field coordinate installation and exact placement with all trades.
- m. Conduit expansion couplings shall be provided in all areas where expansion/contraction may occur to couple together two sections of a conduit run subject to longitudinal movement. The Contractor shall refer to architectural drawings for exact locations of all building expansion joints. Conduit expansion couplings shall be consistent with the size the conduit being installed, shall be steel electrogalvanized, and shall meet all environmental and seismic conditions.
  - 1) Expansion couplings shall be weatherproof and approved for use indoors or outdoors without an external bonding jumper.
  - 2) Expansion couplings shall be UL Listed and approved for use in wet locations.
  - 3) Expansion couplings shall comply with UL 514B, CSA 22.2 No. 18 3-12, NEMA FB1.
- n. Exterior raceways: PVC schedule 40 conduit at the minimum shall be utilized in all underground applications unless otherwise specified by related specification sections. The conduit shall be buried at a minimum 36” below grade. Warning

flagging tape shall be buried 12" below grade to indicate the conduit routing location. Refer to related specification sections for additional information.

- 1) All exterior conduits larger than 2" in diameter shall be provided with dedicated inner-duct conduit systems, segregated by network type (i.e. security, etc.) and shall include a minimum of one spare empty inner-duct per conduit.
  - 2) The Contractor shall have the option to utilize the same trench/routing location as other utilities. In no case shall any system conduits or duct banks be combined with other electrical utilities without providing the required separation between conduits as necessary to ensure the minimal transmission or conduction of any RF and/or EMI signals.
- o. Outlet Boxes: shall be 4 x 4 x 2-1/8 inches deep with single gang reducer plate where required for all data outlet locations and single gang for wall-mounted telephone locations.
    - 1) All outlet boxes shall be provided with single or dual gang device mud-rings flush to finished wall as required based on type and configuration of outlet and type of wall construction.
    - 2) Use deep masonry boxes at masonry construction. T-Bar hangers or other appropriate mounting hardware shall be utilized to support boxes mounted in the ceiling.
3. Cable Trays (Communications Rooms): Provide cable trays in all communications rooms and closets for routing horizontal and vertical distribution and backbone communications cables. All cable trays shall be constructed of aluminum with two side rails and 9" rung spacing. Cable tray shall be complete with all materials, miscellaneous hardware and all appurtenances required for a complete cable distribution and support system.
  - a. All cable tray widths shall be sized according to the total number of cables to be supported within the various trays plus an additional 100% spare capacity for future expansion capability. At the minimum all cable trays installed in communications rooms and closets shall be a minimum of 12" wide by 1.25" deep, unless otherwise noted.
  - b. Install cable tray in a manner ensuring that all circuits fully comply with all ANSI/TIA standards.
    - 1) Maintain a minimum clearance of 24" between top of cable tray and ceiling structure or other equipment or raceway.
    - 2) Maintain a minimum clearance of 12" between bottom of cable tray and top ceiling grid or other equipment or raceway.
    - 3) Maintain a minimum clearance of 24" from all conduits or cables used for electrical power distribution.
    - 4) Maintain a minimum clearance of 12" between bottom of cable tray and top of equipment racks and/or cabinets.
    - 5) Maintain a minimum clearance of 24" from fluorescent lighting. All Pathways shall cross perpendicular to fluorescent lighting and electrical power cables or conduits.
    - 6) Cable tray supports shall be attached to the structural ceiling or walls with hardware or other installation and support aids specifically designed for the cable tray and designed to support the cable tray's weight and required cable

- weight and volume.
  - 7) Do not attach cable tray supports to ceiling support system or other mechanical support systems.
  - 8) Load span criteria: Install tray supports in accordance with the load criteria of L/240.
  - 9) Cable Trays shall be supported at 5-foot intervals.
  - 10) All Cable trays shall be installed without burrs, sharp edges, or projections, which may damage cable insulation.
  - 11) All lengths or sections of cable tray shall be bonded and grounded in accordance with NEC, TIA, IEEE.
- c. Follow manufacturers' instructions for installing, components and adjusting all equipment and cabling. Submit two (2) copies of such instructions to the Architect before installing any equipment. Provide a copy of such instructions at the equipment during any work on the equipment. Where no instructions are included with the equipment, follow accepted industry practices and workmanlike installation standards.

F. Penetrations of Walls and Floors:

1. All wall/floor penetrations are to be sleeved and fire stopped with approved fire stopping material or sealant as applicable for the type of penetration. Coordinate all cable and conduit penetrations of building with all affected trades. Refer to all related specification sections for additional wall/floor penetration requirements.
  - a. All penetrations of rated walls and floors shall be firestopped in accordance with the ASTM and NFPA standards. Refer to related specification sections for additional information.
  - b. Floor penetrations shall be sleeved with a minimum sleeve diameter of 4 inches. An additional penetration shall be provided for future use, sleeved, and capped and fire stopped as required.
  - c. Coordinate size of wall penetration with conduit size, number of conductors. Comply with all NEC requirements.
  - d. The fire rating of all penetrated walls, floors, and ceiling structures shall be strictly maintained. All penetrations shall be firestopped and sealed by the Contractor.
  - e. Install firestopping in open penetrations and in the annular space of penetrations for fire-rated barriers.
  - f. Installation of firestops shall be performed by an applicator/installer qualified and trained by the manufacturer. Installation shall be performed in strict accordance with manufacturer's detailed installation procedures.
  - g. Installation of all firestopping shall be in accordance with fire test reports, fire resistance requirements, acceptable sample installations, manufacturer's recommendations, local fire and building authorities, and applicable codes and shall be installed in a manner acceptable to the authority having jurisdiction.

3.6 ELECTRICAL POWER DISTRIBUTION

- A. Refer to division 26 contract documents for circuiting information.

- B. Refer to specification section 271100 for UPS and PDU material.

### 3.7 TRANSIENT VOLTAGE SUPPRESSION

- A. Transient Voltage Surge Suppression: All cables and conductors extending beyond building façade, except nonconductive fiber optic cables, which serve as communications, control, or signaling circuits shall be protected against Transient Voltage surges and have Transient Voltage Surge Suppression (TVSS) protection.
1. The TVSS device shall be UL listed in accordance with Standard TIA 497B installed at each end. Lighting and surge suppression shall be a multi-strike variety and include a fault indicator.
  2. Protection shall be furnished at the equipment and additional triple solid state surge protectors rated for the application on each wire line circuit shall be installed within 914.4 mm (3 ft) of the building cable entrance. Fuses shall not be acceptable for surge protection applications. All inputs and outputs shall be tested in both normal mode and common mode to verify there is no interference at the minimum surge suppression test shall meet the following criteria.
    - a. All system power supplies serving exterior system components or devices shall be provided with the appropriate transient surge suppression protection on both the line side as well as the load side.
      - 1) A 10-microsecond rise time by 1000 microsecond pulse width waveform with a peak voltage of 1500 volts and a peak current of 60 amperes shall be the minimum performance requirements. Provide surge suppression in accordance with all manufacturers' requirements.
      - 2) An 8-microsecond rise time by 20-microsecond pulse width waveform with a peak voltage of 1000 volts and a peak current of 500 amperes shall be the minimum performance requirements. Provide surge suppression in accordance with all manufacturers' requirements.
      - 3) Maximum series current: 2 AMPS. Provide units manufactured by Advanced Protection Technologies, model # TE/FA 10B or TE/FA 20B or approved equal.
      - 4) Operating Temperature and Humidity: -40 to 85 degrees C (-40 to 185 degrees) shall be the minimum performance requirements. Provide surge suppression in accordance with all manufacturers' requirements.

### 3.8 GROUNDING AND BONDING

- A. All electronic equipment, conduits, cable trays, racks/cabinets and cable shields shall be properly grounded and bonded in accordance with all requirements of EIA/TIA 607-A, NEC 250 and IEEE 1100. Where identified as applicable to the project, all equipment grounding and bonding shall be in accordance with all related specification sections and Motorola R56 Standards and Guidelines for Communications Sites.
1. A Telecommunications Grounding System shall be installed in all communications equipment rooms. Grounding system shall provide equalization of the grounding potentials between the building power system and the telecommunications main grounding bus-bar (TMGB) as well as all telecommunications grounding bus-bars (TGB). Grounding bus-bar

shall provide the diversion of electrical transients from the telecommunications cables and to provide a safety ground for all equipment racks/cabinets, conduits, cable trays and cable shields as well as providing the required coupling to cancel and/or reduce transients.

- a. The TMGB and each TGB shall be provided where indicated on the drawings and shall provide an effective bonding connection to the nearest approved building grounding electrode (e.g., structural steel) as well as to the local power distribution panel grounding system (e.g., ac branch circuit panel board's equipment grounding busbar).
  - 1) The minimum bonding shall be #6 AWG copper conductor connected to the TMGB and all TGB's. Connections shall be 2-hole NEMA type compression or exothermic welded connections.
2. All grounding connections shall provide the equalization of all grounding potentials between the building power system and the grounding terminations at the communications equipment in order to provide the diversion of electrical transients as well as providing the necessary coupling in order to cancel and/or reduce any voltage transients.
  - a. Equipment Grounding: Metallic structures, equipment racks, cabinets, and enclosures as well as all raceways, cable trays, junction boxes, outlet boxes, machine frames, and other conductive items shall be bonded and grounded.
  - b. Duct Banks and Manholes: Provide an insulated equipment grounding conductor in each duct containing any voltage conductors, sized per NEC except that minimum size shall be No. 2 AWG. Bond the equipment grounding conductors to the grounding bus, to all manhole hardware and ground rods, to the cable shielding grounding provisions for all cable splices, terminations, and equipment enclosures.
  - c. Metallic Fences equipped with communications equipment: Fences shall be grounded with a ground rod at each fixed gate post and at each corner post.
    - 1) Drive ground rods until the top is 300 mm (12 inches) below grade. Attach a No. 4 AWG copper conductor, by exothermic weld to the ground rods and extend underground to the immediate vicinity of fence post. Lace the conductor vertically into 300 mm (12 inches) of fence mesh and fasten by two approved bronze compression fittings, one to bond wire to post and the other to bond wire to fence.
    - 2) Each gate section shall be bonded to its gatepost by a 3 by 25 mm (1/8 by one inch) flexible braided copper strap and ground post clamps. Clamps shall be of the anti- electrolysis type.
3. All connections of grounding conductors to ground rods, bus bars, rebar, structural members, pipes, and fences, as well as splices of any ground conductors, shall be made by exothermic welds except where otherwise noted. All connections to bar lugs shall be exothermic weld or compression type connections. Bolted type connection of ground conductors may only be made where terminal lugs or blocks have been furnished and installed in equipment by the manufacturer.
  - a. Equipment grounding conductors shall be insulated stranded copper, except for sizes No. 10 AWG and smaller shall be solid copper. Insulation color shall be continuous green for all equipment grounding conductors, except that wire sizes No. 4 AWG and larger shall be permitted to be identified per the NEC.

- 1) At the minimum bonding connection shall be a #6 AWG copper conductor. All grounding shall provide an effective bonding connection between the protected equipment to the nearest approved building grounding electrode (structural steel) as well as to the local power distribution panel grounding system (e.g., ac branch circuit panel board's equipment grounding busbar). All bonding and grounding connections shall be NEMA type compression or exothermic welded connections.
4. Refer to related specification sections for any additional grounding and bonding requirements.

### 3.9 EQUIPMENT IDENTIFICATION

- A. Identify all system controls, components and equipment cabinets using plastic laminate engraved ("limacoid") labels or approved equal. Firmly affix to the panel, device and/or component. Refer to all related specification sections for additional information.
  1. Nameplates shall be laminated black phenolic resin with a white core with engraved lettering, a minimum of 6 mm (1/4 inch) high. Secure nameplates with screws. Nameplates that are furnished by manufacturer as a standard catalog item or where other method of identification is herein specified. Dymo or Kroy tape adhesive-backed lettering shall not be acceptable.
  2. Color-code all junction boxes and enclosures per NEC recommendations. At the minimum provide all communications junction boxes as follows:
    - a. Color for Data/Telecommunications circuits - Yellow.
    - b. Color for Audio/Visual circuits – White
    - c. Letter all pull boxes and junction boxes located in service areas, tunnels, above accessible ceilings, and pipe chases with laminated black phenolic resin with a white core with engraved lettering, a minimum of 6 mm (1/4 inch) high. Secure nameplates with screws.
  3. Permanently label all cabling at both ends with self-adhering plastic labels.
    - a. Labeling: hand-written labels are not acceptable. All labels shall be machine printed on clear or opaque tape, stenciled onto adhesive labels, or type written onto adhesive labels. The font shall be at least one-eighth inch (1/8") in height, block characters, and legible.
      - 1) The text shall be of a color contrasting with the label such that it may be easily read. If labeling tape is utilized, the width of the tape shall not exceed 3/8," and the font color shall contrast with the background.
      - 2) All data patch panels shall exhibit data drop numbers, in sequential order, for all workstations served by the associated network equipment.
      - 3) Each fiber optic cable segment shall be labeled at each end with its respective communications network identifier.
      - 4) Warning Tags: At each location where the fiber cable is exposed to human intrusion, it shall be marked with warning tags. These tags shall be yellow or orange in color and shall contain the warning: "CAUTION FIBER OPTIC CABLE." The text shall be permanent, black, block characters, and at least 3/16" high.

- a) A warning tag shall be permanently affixed to each exposed cable or bundle of cables, at intervals of not more than five (5) feet. Any section of exposed cable which is less than five (5) feet in length shall have at least one warning tag affixed to it.
4. Provide typewritten circuit directories installed in 3-ring binders with transparent page protectors in each control and sub control cabinet and/or equipment rack.

### 3.10 WARRANTY

- A. Warrant material and workmanship for a period as specified in Division 1 of the contract documents and all related specification sections. The warranty period shall commence from the date the Contactor received written notification of final acceptance from Owner. At the minimum the Contractor shall provide warranty provisions:
  1. Warrant the replacement of defective components/materials and/or correct defective work when given notice by Owner during the warranty period.
    - a. At no time is the Contractor to use the extra materials provided under the scope of this project to replace malfunctioning or damaged equipment and or components. The Contractor shall replace all malfunctioning or damaged equipment and or components with new. The repair and then reinstallation of malfunctioning or damaged equipment shall not be acceptable.
  2. Warranty excludes liability for consequential incidental, or special damages due to vandalism, misuse, or acts of God.
  3. On-site warranty response time by qualified technician shall be within 8 hours upon receipt of request from Owner.
  4. Warranty repairs shall be provided to Owner at no cost. This shall include but not limited to replacement of all defective components/materials, all labor charges, all travel costs, and all vehicle charges.
  5. Response time shall be 7 days a week / 24 hours a day / 365 days a Year.
  6. Provide test, inspection, and service of each system on a semi-annual basis at six month intervals.
  7. Contractor must provide verification that they maintain their principle base of operation along with the personnel that will be responsible for providing service within 3 hours driving time to the project site. This tenet of the warranty shall remain in effect for the life of the warranty.
  8. All TCP/IP based communications systems cabling, and related appurtenances shall be provided with the manufacturers 25 year extended warranty in addition to all requirements above.
- B. The Contractor shall, as a condition of final payment, execute a written warranty certifying all contract requirements have been completed according to all requirements of the Contract Documents.
  1. All system testing, commissioning, demonstration, and training shall be performed prior to final system acceptance. All defects or damages due to faulty materials or workmanship shall be replaced without delay, to the satisfaction of Owner, at the Contractor's expense.
    - a. The Contractor shall provide written documentation of test results and stating what

was done to correct any deficiencies. The first inspection shall occur 90 calendar days after the acceptance date. The last inspection shall occur 30 calendar days prior to the end of the warranty.

- b. The warranty period shall be extended until the last inspection and associated corrective actions are complete. Where any equipment and/or labor covered by Contractor's or manufacturer's warranty, has been replaced, due to failure, the warranty period for any replaced equipment or restored work shall be reinstated for a period equal to the original warranty period, and commencing with the date of completion of the replacement or restoration work.
2. In the event any manufacturer customarily provides a warranty period greater than one (1) year, the Contractor's warranty shall be for the same duration for that component.

### **3.11 FIELD SERVICES AND TESTING**

- A. Notify Owner and the Design professional in writing, prior to the closing of any ceilings and ten (10) days advance of testing all system cabling to prevent delays in construction schedules.

1. Test all cabling to confirm that no grounds, shorts, sneak currents, RFI and EMI conditions exist prior to start-up and commissioning of all, components, devices, equipment and/or systems.
  - a. Before requesting a final inspection, the Contractor shall perform a series of end to end installation performance tests. The Contractor shall submit for approval by the Project Engineer and Design Professional all test procedures to be employed, test result forms, and timetable for testing all fiber optic and structured copper wiring.
  - b. Acceptance of the simple test procedures discussed below is predicated on the Contractor's use of the recommended products including but not limited to, fiber optic cable, category structured cable, cross-connect blocks, patch panels, and outlet devices specified and adherence to the inspection requirements and practices set forth. Acceptance of the completed installation will be evaluated in the context of each of these factors.

- B. Balanced Twisted Pair Cable Testing

1. Minimum Test Parameter requirements for Category horizontal cabling.
  - a. Each wire/pair shall be tested at both ends for the following utilizing Contractor generated test results forms:
    - 1) Wire Map.
    - 2) Length.
    - 3) Insertion Loss.
    - 4) Near-end crosstalk (NEXT) loss.
    - 5) Power sum near-end crosstalk (PSNEXT).
    - 6) Equal-level far-end crosstalk (ELFEXT).
    - 7) Power sum equal-level far-end crosstalk (PSELFEXT).
    - 8) Return loss.
    - 9) Propagation delay.
    - 10) Delay Skew.
    - 11) Power Sum ACR.

- b. All balanced twisted pair cable testing described herein shall exceed specified cabling transmission requirements of ANSI/TIA-568-C.
2. When errors are found, the source of each error shall be determined, corrected, and the cable re-tested. All defective components shall be replaced and retested. Defective components not corrected shall be reported to Owner and the Design professional with explanations of the corrective actions attempted.
3. Test records shall be maintained using the approved test result forms. The form shall record closet number, riser pair number or outlet ID, outcome of test, indication of errors found (e.g., a, b, c, d, or e) cable length, re-test results after problem resolution and signature of the technician completing the tests.
4. Test results for each cable must be submitted with identification to match labels on all patch panel ports and 8 position modular jacks, and identification to match as-built drawings associated with that cable.
5. Owner and the Design Professional shall observe and verify the accuracy of test results submitted.
6. Contractor shall submit both hardcopy printouts and electronic copy of all trace test results.

**C. Fiber Optic Testing**

1. Contractor shall test each fiber strand. Owner and the Design Professional reserve the right to have a representative present during all or a portion of the testing process. If Owner and the Design Professional elect to be present during testing, test results will only be acceptable when conducted in the presence of Owner and the Design Professional.
2. Fiber optic cable: each fiber strand shall undergo bi-directional testing for signal attenuation losses.
  - a. Test Equipment
    - 1) Optical Power Meter (OPM)
    - 2) Optical Time-Domain Reflectometer (OTDR)
  - b. Tests:
    - 1) All fiber strands shall be tested for attenuation using an Optical Power Meter in both directions at 1310 nm and 1550 nm.
    - 2) Test all fiber cable on the reel before installation, with a light source and an OTDR if necessary, to ensure fiber continuity and no factory defects.
3. Fiber Optic Testing Specifications
  - a. All testing shall be performed by factory trained and certified personnel.
  - b. For all installed fiber optic cable EIA 455-171 Method D procedures will be adhered to (Bi-directionally).
  - c. Loss Limits:
    - 1) Connector loss shall not exceed 0.5 dB per connector pair
    - 2) Cable loss shall not exceed 1.0 dB per kilometer tested at 1310 nm and 1550 nm for premises/inside plant single mode fiber optic cable.
    - 3) Cable loss shall not exceed 0.5 dB per kilometer tested at 1310 nm and 1550

- nm for outside plant single mode fiber optic cable.
    - 4) Fiber optic cable tests shall meet all other requirements as specified in TIA 568.C.
  - d. The Contractor is responsible for obtaining minimum loss in fiber connections.
  - e. Pre-installation tests of Inter-plant fiber: pre-test each reel:
    - 1) Test each fiber strand of each reel for continuity with a light source.
    - 2) If a problem is found, test with an OTDR to determine the nature and location of the defect: Measure end-to end attenuation and the distance to a high attenuation point.
    - 3) If it is determined by Design Professional that the fiber is defective the Contractor shall contact the manufacturer and provide a completely new fiber reel.
  - f. Tests for installed Inter-plant and Intra-plant fiber optic cable:
    - 1) Intra-plant and Inter-plant Single-mode: Bi-directional signal attenuation at 1310 and 1550 nm power meter.
    - 2) Inter-plant Single-mode: Bi-directional OTDR trace at 1310 and 1550 nm.  
OSP ONLY

NOTE: Obtain the actual index of refraction from the cable Manufacturer before testing.
  - g. Single-mode backbone links shall be tested as listed above and in accordance with ANSI/TIA-526-7, Method A.1, using not more than one reference jumper. All multimode backbone links shall be tested at 850 nm and 1300 nm in accordance with ANSI/TIA-526-14A, Method A.1, using not more than one reference jumper.
- 4. Power and Link Loss Budgets
  - a. Contractor shall prepare and submit a fiber optic power and link loss budget report for all backbone fiber optic cabling links as part of shop drawing submissions.
  - b. The report shall include the Power Budget, Link Loss, and Power Margin utilizing industry-standard formulas for each backbone fiber optic link.
  - c. Submit all test reports for approval; an OTDR trace/signature report for every optical fiber strand and a fiber optic link attenuation record report for every cable by strand.
- D. Notify Owner and the Design Professional in writing, ten (10) days advance of testing of all equipment and/or components to prevent delays in construction schedules.
  - 1. Perform all tests, as required, by authorities having jurisdiction throughout the facility.
  - 2. Test system for grounds to demonstrate that the ground resistance does not exceed the requirements of the National Electric Codes (NEC).
  - 3. Test all cabling to confirm that no grounds, shorts, sneak currents, RFI and EMI conditions exist prior to start-up and commissioning of all, components, devices, equipment and/or systems.
  - 4. Test all systems and components for proper function and operation; certify that all systems are in proper working operation in accordance with the Contract Documents prior to scheduling any system demonstrations.

5. Test all fiber optic cabling as shown in Section C above.
6. Testing of all communications systems shall be in the presence of Owner and the Design Professional (if they so choose) as well as all appropriate representatives of the authorities having jurisdiction.
  - a. All completed communications systems shall be fully tested in accordance with all requirements of TIA. Upon completion of a successful testing, the Contractor shall so certify in writing to Owner and the Design Professional that all testing was completed, certified, and left in first-class operational condition, include all completed copper and fiber testing read-outs, certifications, and test reports.
  - b. The service of a competent, factory-trained engineer or technician authorized by the equipment manufacturer shall be provided to technically supervise installation and participate during initial system programming, start-up, final testing, assist in the final acceptance testing and demonstrations.
7. Provide all testing, commissioning and certifications as specified by Division 01 and this specification section, as well as any manufacturer's recommendations or requirements.

E. Tester Criteria

1. General
  - a. Tester shall employ a modular platform with a minimum of a 2.0 Ghz processor.
  - b. Tester shall be Level IV/V ETL Verified.
  - c. Tester shall have hot swappable fiber modules and employ modules for:
    - 1) Multi-Mode capable of testing at 850 & 1300 nm
    - 2) Single Mode modules capable of testing at 1310 & 1550 nm
  - d. Tester shall have a current calibration date. If testing will go past calibration date, Contractor shall have tester re-calibrated.
  - e. Tester shall be running current firmware.
  - f. Tester will be capable of performing 1,2 & 3 jumper set reference. One jumper is recommended.
  - g. Set reference shall be done with factory provided test reference cords (TRC's)
2. The field-test instrument shall be within a 12-month calibration period.
3. Certification tester
  - a. Accuracy
    - 1) Level IV/V accuracy in accordance with ANSI/TIA-1152-A
    - 2) Independent verification of accuracy shall be provided.
4. Permanent Link Adapters
  - a. RJ45 plug must meet the requirements for NEXT, FEXT and Return Loss in accordance with ANSI/TIA-568-C.2 Annex C
  - b. Contractor shall perform a successful set reference prior to the start of any project.
  - c. Twisted pair Category 5e, 6, 6A, cords are not permitted as their performance degrades with use and can cause false Return Loss failures.
5. Results Storage

- a. Must be capable of storing > 5000 results for all measurements.
6. Reporting:
- a. Tester shall be capable of exporting raw data files in native format.
  - b. Reporting Software shall be capable of producing.
    - 1) Detailed Fiber Certification reports in .PDF format
    - 2) Summary fiber reports in .PDF
    - 3) Fiber reports in CSV format.

### 3.12 TRAINING

- A. In addition to all demonstration and training as specified by Division 01 specification section and all related Division 27 specification sections, system demonstrations and training shall be provided in accordance with all requirements of this section.
- 1. Prior to acceptance of the work, the System Integrator shall demonstrate to Owner and the Design Professional, all systems and sub-systems all features and functions of each system and shall instruct Owner in the proper operation, event sequences, programming and maintenance of all systems and sub-systems.
  - 2. The ICTI shall furnish the necessary trained personnel to perform all demonstrations and instructions and arrange to have the manufacturer's representatives present to assist with the demonstrations.
  - 3. Training time shall include, as a minimum, the total time determined by the sum of the times per system as specified in this and related specification sections, for performing the prescribed demonstrations/training. Refer to related specification sections for additional training requirements.
    - a. Allow a minimum of 16 hours' time for each system provided for performing the prescribed demonstrations/training.
  - 4. Provide operation, parts and maintenance manuals defining operation and troubleshooting methods of all systems and review with Owner's User/Operators as part of training demonstrations.
  - 5. Provide detailed video recordings in high quality digitally formatted media of all demonstration and training of all systems and system operations.
    - a. Utilize remote microphones as may be required to ensure high quality audio of the recorded demonstrations.
    - b. Permanently and professionally label all recorded materials and provide self-sealing plastic cases.
- B. Inspections
- 1. At the completion of the project and prior to final acceptance of the Work, provide evidence of final inspections and approvals to Owner and the Design Professional, in accordance with all requirements of the Contract Documents as well as required by the authorities having jurisdiction.

**END OF SECTION 27 05 00**

**SECTION 27 11 00**

**NETWORK COMMUNICATIONS SYSTEMS**

**PART 1 - GENERAL**

**1.1 STIPULATIONS**

- A. The specifications sections "General Conditions of the Construction Contract", "Special Conditions", and "Division 1 - General Requirements" form a part of this Section by this reference thereto and shall have the same force and effect as if printed herewith in full.
- B. Related Sections:
  - 1. Division 07 – Through-penetration Firestop Systems
  - 2. Division 26 – Common Work Results for Electrical
  - 3. Division 26 – Low Voltage Electrical Power Conductors and Cables
  - 4. Division 26 – Grounding and Bonding for Electrical Systems
  - 5. Division 26 – Hangers and Supports for Electrical Systems
  - 6. Division 26 – Raceways and Boxes for Electrical Systems
  - 7. Division 26 – Identification for Electrical Systems
  - 8. Division 27 – General Requirements for Telecommunications
  - 9. Division 27 – Common Work Elements for Communications Systems
  - 10. Division 27 – Network Communications Systems
  - 11. Division 27 – Two-Way Communications System
  - 12. Division 27 – Audiovisual Systems
  - 13. Division 28 – Common Work Elements for Electronic Safety and Security
  - 14. Division 28 – Physical Electronic Safety and Security
  - 15. Division 28 – Video Surveillance System
- C. Reference Symbols:
  - 1. All device symbols are defined by the appropriate symbol schedules. Because of the scale of the drawings, symbols are shown on drawings as close as possible to the mounting location.
    - a. Contractor shall coordinate exact locations with all architectural drawings, site plans, reflected ceiling plans, furniture plans, mechanical and electrical drawings as well as all affected trades prior to submittal of any shop drawings.
- D. Abbreviations:
  - 1. Refer to Specification Section 27 05 00 for additional information.
- E. Definitions:
  - 1. Refer to Specification Section 27 05 00 for additional information.

## 1.2 SUMMARY

- A. The intent of this specification is to establish a standard of quality, overall system configuration and equipment requirements for the installation of a new structured cabling system and audio/visual equipment in support of a facility TCP/IP network and specified Audio/Visual systems. The contractor shall be responsible for providing all design, installation, programming, commissioning, testing and certifications as necessary to provide complete infrastructure to support all TCP/IP telecommunications networks in accordance with the Contract Drawings and/or as herein specified.
- B. All communications network cabling for TCP/IP-based Security systems as specified in Division 28 shall also meet the requirements of this section.
  - 1. The installation, performance, features, functions, software, and programming criteria as specified herein as well as all related specification sections have been designed to offer the maximum system efficiency ease of operation, occupant safety and the protection of equipment as recommended by the design Professional.
    - a. Any deviations from the specified criteria shall be documented, reviewed, and agreed to in writing by Owner and the Design Professional prior to submission of bids. Refer to Division 01, Division 28, and all related Division 27 specification section for product substitutions.
  - 2. It is the responsibility of the contractor to ensure that the installed system meets or exceeds every standard set forth in these specifications. The contractor shall provide all cabling, communications outlets, conduits, system components, termination equipment, racks/cabinets, emergency electrical power, software, programming, and all appurtenances as well as all necessary testing, commissioning and certifications as required to provide a complete and fully operational TCP/IP based network, whether such items are specifically included in this section or not.
- C. The contractor shall furnish all labor, equipment, materials, testing, commissioning, programming, and certification in connection with the installation of a complete premises communications network system as indicated on the drawings and as herein specified.
  - 1. The systems shall be complete with all equipment as indicated on the contract drawings and/or described herein.
    - a. The systems shall include at the minimum but not limited to the following:
      - 1) Plenum rated cabling.
      - 2) Fiber Optic Cabling (Network Backbone)
      - 3) Coaxial Cabling (MATV/CATV distribution)
      - 4) Conduit/Duct/Raceway/Cable Tray Systems
      - 5) Distribution/Termination Patch Panels
      - 6) Equipment Racks/Cabinets
      - 7) Communications Outlets/Jacks
      - 8) Equipment bonding and grounding.

- D. The contractor and all sub-contractors for this work shall have read all of the General Conditions, Special Requirements, General Requirements and all applicable related specification sections and in the execution of all work shall be bound by all of the conditions and requirements therein.
- E. Prior to the submission of the Bid, any discrepancies or inconsistencies noted within these specifications and/or the project drawings shall be brought to the immediate attention of Owner and the Design Professional.
  - 1. Project specifications and drawings may not deal individually with every component, control, device, or appurtenance, which may be required to produce the specified system configuration, and/or as necessary to meet the equipment and cabling requirements. Coordinate all integration requirements with Owner and the Design Professional and all appropriate systems providers.
  - 2. Because of the scale of the drawings, symbols are shown on drawings as close as possible to the mounting location. The contractor shall coordinate the installation of all cabling, materials, equipment, devices, jacks, cable trays and conduits with all affected trades and document all coordination at the time of shop drawing submittals.
- F. This contractor shall assume total responsibility for coordinating all inter-building wiring, any common carrier provided network equipment, and/or Owner provided equipment as it relates to the operation of these systems.

### 1.3 SCOPE OF WORK

- A. The contractor shall furnish all labor, equipment, materials, cabling, and the performance of all testing, commissioning, and certification in connection with the installation of a complete premises TCP/IP-based communications network structured cabling system and specified audio/visual systems in accordance with all requirements of the project drawings and/or as herein specified.
  - 1. Provide and install all equipment described herein, including, but not limited to all, jacks/outlets, Category-6 & Category-6A cabling, fiber optic cabling, coaxial cabling, patch panels, distribution hardware, and patch cables as well as all conduits, outlet boxes and appurtenances necessary to provide complete and fully operating network communications structured cabling system.
  - 2. Provide and install all equipment described herein, including, but not limited to all, video displays, projectors, video signal encoders, audio equipment and video processing equipment.
- B. Communications Systems Design Requirements:
  - 1. Provide a complete operational communications network infrastructure including but not limited to all cabling, jacks, cabling distribution and termination components as indicated on the contract drawings and as herein specified.
    - a. All horizontal network connections shall utilize copper cabling and hardware for distribution to all control equipment as indicated on the contract drawings. All horizontal cabling shall be bundled and routed through the facility on "J" hooks sized to support the network cabling requirements and shall terminate on

Category-6 and Category 6A patch panels in the communications equipment enclosures.

- 1) NOTE: Cables shall not be cinched too tightly; cable ties at patch panel locations shall be hook-and-loop type tie-wraps only. Plastic wire ties shall not be accepted on any cabling.
- b. All communications cabling shall be terminated at both ends of the permanent link at all equipment locations, fiber optic, coaxial and patch panels.
- c. The Contractor is responsible for the installation of the entire network communications infrastructure: including all workmanship, standards of quality, adherence to the contract documents, certification testing, as-built documentation, labeling, and final warranty in relationship to the performance and installation of the structured cabling systems in accordance with the contract drawings and/or as herein specified.

C. Backbone Performance Requirements:

1. The intended function of the communications network is to transmit data communications signals from a central location to several individual data drop locations. Upon completion of the work in accordance with the contract documents, the system shall be capable of transmitting data signals at a rate of 1000 Mbps minimum over Category-6 & Category-6A cable and a minimum of 10Gbps over single-mode fiber optic cables based upon the transmitting distance, laser attenuation and number of links.
  - a. Multimode OM4 50/125 micron (nominal) optical fiber cable.
  - b. Single-mode OS2 8.3/125 micron (nominal) optical fiber cable shall be capable of transmitting signals at both 1310 and 1550 nm capable of providing a nominal 5km @ 1GBPS @1000 Base LX and nominal 10km @ 10GBPS @10GBASE-LX4 transmission rates.
  - c. All fiber optic cable shall be terminated on LC-type connectors and ports.
2. The Contractor must certify in writing that the structured cabling system(s) are installed in accordance to the project documents, the referenced standards as well as all manufacturer requirements.
3. In addition, the contractor shall provide in writing all extended manufacturers' warranties for matching compatibility of the structured cabling system as well as all as-built drawings and field test reports for both the fiber and copper cabling systems before Owner and the Design Professional will accept the installation.

1.4 SUBMITTALS

- A. Refer to Specification Section 27 05 00 for additional information.

1.5 RECORD DOCUMENTS

- A. Provide Owner with complete set of record drawings in accordance with the requirements of Section 27 05 00.

## **PART 2 - PRODUCTS**

### **2.1 GENERAL**

- A. Manufacturers listed as acceptable or equal shall not negate the contractor's responsibility for providing all systems in accordance with all functions and performance requirements of the Contract Documents.
- B. Where manufacturer and/or model numbers reference specific system components in this specification, it is to establish the performance requirements and quality of the systems and components only.
  - 1. It is in no way an inference that the referenced model numbers are the manufacturer's current product and are the only acceptable components for this project unless specifically referenced as "no substitutions."
  - 2. Contractor shall provide the manufacturers' most current product that shall meet and/or exceed the specified performance and features of all data, and telecommunications equipment and/or systems.
  - 3. Equivalent UL- listed equipment may be substituted for the approved manufacturers in accordance with all requirements of Division 01 specification section titled "Substitutions" and/or General Conditions to the Construction Contract and where approved equal is referenced in the specific specification section.
    - a. Where systems and/or components are referenced as "no substitutions," the specific system and/or components shall be provided.
    - b. All substitutions shall comply with all requirements as specified in related specification sections and all system performance standards shall be maintained.
    - c. The contractor shall stipulate at the time of submission of bid the following information impacted by such a substitution.
      - 1) Any and all extensions in time impacted by the substitution.
      - 2) Any changes to the architectural or structural elements to the project.
      - 3) Differences in operation and/or performance from intended system criteria.
    - d. Failure to provide the required substitution information shall result in, without consideration, the immediate rejection of the substituted equipment and/or systems.
- C. Unless specified otherwise, the equipment furnished shall fall into six classes, and with the exception of Class 6, all of the material within a single class shall be the standard product of one manufacturer. Exceptions are noted as "Class Exempt." The six classes are as follows:
  - 1. CLASS ONE-A (1A): Category-6, Category-6A and Category-3 UTP, and Category-6 F/UTP copper cables (both horizontal and backbone), Category-6 patch cords, blocking kits, interconnection devices, connectors, wiring blocks, patch panels, and telecommunications outlets. Refer to applicable specification paragraphs for acceptable product manufacturers.

- a. Note: All material covered in “Class One-A” shall conform to all manufacturers’ cable/component matching connectivity requirements for the connection of all communications outlets, patch panels and cabling appurtenances provided as part of this project.
    - b. Other cabling systems meeting the listed performance and warranty requirements will be considered following compliance with all substitution requirements in accordance with Division 1 specification section titled “Substitutions.”
  2. CLASS ONE-B (1B): Fiber Optic Cable (both horizontal and backbone), fiber optic jumpers, interconnection devices, connectors, wiring blocks, patch panels, and telecommunications outlets. Refer to applicable specification paragraphs for acceptable product manufacturers.
    - a. Note: All material covered in “Class One-B” shall conform to all manufacturers’ cable/component matching connectivity requirements for the connection of all communications outlets, patch panels and cabling appurtenances provided as part of this project.
    - b. Other cabling systems meeting the listed performance and warranty requirements will be considered following compliance with all substitution requirements in accordance with Division 1 specification section titled “Substitutions.”
  3. CLASS TWO: Inner-duct systems. All material covered in “Class Two” shall be equal in quality and performance to that manufactured by Carlon, Eastern Wire+Conduit, Endot or approved equal.
  4. CLASS THREE: Equipment racks, Wire Management Systems and Cable Trays. All material covered in “Class Three” shall be equal in quality and performance to that manufactured by Eaton (Formerly Cooper) B-Line, Chatsworth Products Inc., Legrand or approved equal.
  5. CLASS FOUR: Communications Equipment Cabinets and Wire Management Panels.
  6. CLASS FIVE: hook and loop wire ties/cable wraps, storage rings, labels, "D" rings (metal only), nuts, bolts, screws, and other miscellaneous and hardware.
  7. CLASS SIX: Active network systems/Equipment/Hardware
- D. All equipment and peripheral devices shall be the standard product of a single manufacturer and shall display the manufacturer's name on each component.

## 2.2 COMMUNICATIONS NETWORK EQUIPMENT AND COMPONENTS

- A. Data Communications Outlets (Category 6 & 6A)
1. Data Jacks/Faceplates: 4 pair, TIA/EIA-568B pinning, Category-6 compliant.
  2. Modular Outlet Jacks & Faceplates: Standard 8-position, RJ-45 style, un-keyed, designed for 4-pair, 100 ohm balanced unshielded twisted pair (UTP) cable, 26-22 AWG solid or stranded conductors.
  3. Acceptable manufacturers for this project shall include Commscope Uniprise, or approved equal.
  4. Accessories: Category-6 & Category-6A Jacks or approved equal include a translucent stuffer cap for wire retention and to permit visual inspection. Jacks shall have attached wiring instruction labels to permit either T568A or T568B wiring configurations.

- a. Modular Mounting Plates:
  - 1) All mounting plates shall be supplied with mounting screws, clear screw covers and paper labels, and color matched screw covers. Office White – flush mounted with screws. Coordinate final color selection with architect.
- B. Equipment Cabinets/Patch Panels/Appurtenances
  - 1. Approved Manufacturers:
    - a. Commscope Uniprise
    - b. Or approved equal
  - 2. Provide wall-mounted communications equipment enclosures where indicated for all locations as indicated on the contract drawings. All wall-mounted enclosures shall meet the following requirements:
    - a. The enclosure shall be a UL listed; EIA compliant 19” horizontal distribution rack.
    - b. Minimum (26) EIA standard 19” rack units (RU)
    - c. 30” minimum usable equipment mounting depth
    - d. Front mesh door with lock
    - e. Locking swing-open center section for front and rear access
    - f. Adjustable rack rail
    - g. Integrated cable management
    - h. Electrical knock-outs for conduits on rear section/pan
    - i. UPS sized for all equipment with floor-standing or rack-mounted options.
    - j. Horizontal Power Distribution Unit (PDU)
    - k. Position and install rack so as to permit full swing of rack away from wall without obstruction.
  - 3. Provide floor-mounted communications open frame equipment racks where indicated for all locations as indicated on the contract drawings. All racks shall meet the following requirements:
    - a. The rack shall be a UL listed; EIA compliant 19” horizontal distribution black in color.
    - b. 2-post with top plates and bottom plates for use with ½” anchoring hardware consisting of drop-in anchors, hex head bolts and fender washers on all mounting holes.
    - c. Double-sided vertical wire managers on both sides as indicated on the contract drawings.
    - d. Rack-mounted UPS sized for all equipment.
    - e. Vertical Power Distribution Unit (PDU)
    - f. Grounding busbar
  - 4. Provide Fiber Optic Patch Panels (FOPP’s) in sufficient quantities to support all fiber terminations as indicated on the contract drawings:
    - a. Commscope or approved equal

- b. All housings: Provide with pigtailed cassettes, (6) duplex LC ports per cassette (12 strands per panel), Single-Mode. Provide cassettes in sufficient quantities to terminate all incoming fiber optic strands.
    - c. Furnish housings with minimum 20% spare cassette slot capacity for addition of future panels.
  - 5. Provide Modular Category 6 and Category 6A copper patch panels in sufficient quantities to support all Category 6 and 6A cabling terminations as indicated on the contract drawings:
    - a. Patch panels shall contain 110-block rear terminations for horizontal cabling and RJ-45 front connections for patch cords.
    - b. Patch Panels shall be 24-port and 48-port TIA-568B wired Category 6 rated.
  - 6. Patch Cables, Category 6, high performance: Commscope Uniprise or approved equal.
    - a. Patch cables shall be provided in standard lengths of three (03), five (05), seven (07), ten (10) or (15) feet.
    - b. Provide Two (2) patch cables for each populated patch panel port; one in the communications room, and one in the work area/space.
      - 1) Patch cables in the communications room shall be of minimum length to permit installation without stress or strain at connection points to equipment, to permit relocation of cable to a different port on the same device, and to permit neat and workmanlike cable routing through cable management devices.
      - 2) Patch cables in the work area/workspace shall be (15) feet in length.
    - c. All patch cables shall be TIA-568B compliant and meet all product matching criteria.
    - d. All patch cables shall be provided with jacket colors as specified elsewhere in this section.
    - e. All Category 6 Patch cords must be provided by the same manufacturer as part of a certified structured cabling system and shall be color coordinated in accordance with cable and jack color coding requirements.
  - 7. Network equipment cabinet wire management: Provide wire management devices in network equipment cabinets as shown on the drawings and described in these specifications:
    - a. 1 Rack Unit (RU) Horizontal Wire Manager:
    - b. 2 Rack Unit (RU) Horizontal Wire Manager:
    - c. Provide hook-and-loop tie-wraps as required for neat and tidy rear cable management.
- C. Category 6 Cable – Data Network Communications
  - 1. Category 6 Cable shall be “CAT6” cable tested to a minimum of 250Mhz, plenum-rated (CMP):

1. Provide fiber cabling in accordance with the requirements of all related specification sections, at the minimum 12-strand single-mode cable unless otherwise indicated by the contract drawings.
  - a. Premise Distribution Interlocking-Armored plenum.
  - b. Acceptable manufacturers shall include Commscope or approved equal.
2. Fiber Optic Cable Terminations
  - a. All fiber optic cable shall be spliced on to splice-on connectors in the equipment racks.
  - b. All splices shall be fusion type. Mechanical splices shall not be acceptable.
  - c. All fiber optic connectors and patch panel ports shall be duplex SC/APC type.

**D. Coaxial Cable (MATV/CATV Distribution)**

1. Use RG-6/U cable for horizontal cable distribution drops to TV drop locations or as recommended by manufacturer.
2. Use RG-11/U cable for drops to TV locations or as recommended by manufacturer.
3. All coaxial cabling must be UL Listed, NEC type CL2 or CATV, Tri Shield, 75-Ohm cable installed in dedicated conduits.
4. Terminate all coaxial cable on coax patch panels in the equipment cabinet. At TV locations, terminate coaxial cable on single-gang wall plates with F-type connectors as shown on the contract drawings.

**2.3 EQUIPMENT POWER DISTRIBUTION**

**A. Uninterruptable Power Supply (UPS)**

1. Provide minimum 6kVA UPS at the bottom of each rack/cabinet, unless otherwise specified.
2. UPS shall be high density, double-conversion on-line power protection with scalable runtime. Runtime shall be minimum 30 minutes at full load.
3. UPS shall include web-based network management card with SNMP.
4. Provide all mounting hardware and cables.
5. Include floor-standing and rack-mounted options.

**B. Rack Mounted Power Distribution Unit (PDU)**

1. Provide rack mounted power distribution switch with surge protection for the distribution of all UPS connected power for each rack. The unit shall consist of a minimum of 12 AC power outlets, dual fed A/B circuiting, rated at 15 amps each and shall be equipped with integral surge protection circuitry (with bypass switch) capable of auto-resetting over-voltage and under-voltage protection.
2. The unit shall include a front mounted power switch (with guard) which shall control all 12 outlets. The four front mounted power outlets shall be spaced as transformer convenience outlets. The overall unit shall be single-height rack mountable chassis (1U) with three front panel indicator lights: (Power, Ground OK and Unsafe Voltage) and shall

include front panel circuit breaker for protect or disconnect circuitry and dual 10-foot power cords for electrical power connectivity. The rear panel grounding lug shall be provided.

3. In addition to the above requirement the power distribution unit shall meet the following minimum requirements:
  - a. Integral Surge Protection Circuitry (with by-pass switch): Yes
  - b. Dual A/B Incoming Power Circuiting
  - c. Protect or Disconnect Circuitry: Yes
  - d. Thermal Fusing: Yes
  - e. Catastrophic Surge Circuit: Yes
  - f. Over/Under voltage Protection: Yes
  - g. Overvoltage Shutoff Gate: 144V  $\pm$ 11V
  - h. Under voltage Shutoff Gate: 84V  $\pm$ 6V
  - i. Single Pulse Energy Dissipation: 1350 Joules
  - j. Peak Impulse Current: 32,000A
  - k. EMI/RFI Noise Filtration: 50db (99.7%)
  - l. Line Voltage: 120VAC, 50/60Hz
  - m. Initial Clamping Level: 200V Peak, 141 Rms
  - n. UL 1449 Rating: 500V L-N, 500V L-G, 400V N-G
  - o. Protection Modes: L-N, L-G, N-G
  - p. Maximum Current Rating: 15A (1800W)
  - q. Response Time: 1-5 Nanoseconds
  - r. Plug Configuration: Straight
  - s. Number of Outlets: 12 (4 front, 8 rear)
  - t. Switched Outlets: All

### **PART 3 – EXECUTION**

#### **3.1 EQUIPMENT PROTECTION**

- A. Comply with all requirements of Specification Section 270500.
  1. Examine all physical and environmental conditions, equipment and device locations, auxiliary system connectivity requirements impacting the installation of all network systems and report any unsatisfactory conditions in writing to Owner and the Design Professional.

#### **3.2 WORK PERFORMANCE**

- A. In addition to all requirements as specified by Specification Section 270500 the network communications systems shall also be provided in accordance with the following requirements:
  1. Prior to the final commissioning and/or programming of any network communications components, the Contractor shall provide a review with Owner and the Design Professional addressing all network integrations, programming, and related operational connectivity.

- a. Failure to provide this review and get final sign-off prior to programming shall result in any costs related to changes requested by Owner and the Design Professional as not being charged to the project.

### 3.3 EQUIPMENT/CABLE INSTALLATION AND REQUIREMENTS

- A. In addition to all requirements as specified by Specification Section 270500 the network communications systems shall also be provided in accordance with the following requirements:
  1. All system cabling shall be of the type, size and specification as required by all contract documents as well as stipulated by all codes and standards as specified by Specification Section 270500.
  2. All network communications cabling shall be installed in accordance with the requirements of Specification Section 270500. All network cabling bundles shall not contain any AC carrying conductors or non-associated network communications cables within the cable raceways/conduits or cable bundles.
    - a. In addition, all structured cabling associated with the installation of any network communications system shall comply with all requirements of TIA standards for the proper installation, termination and testing of all fiber optic and UTP cabling.
    - b. Contractor shall provide all equipment, components, devices, hardware, equipment racks/cabinets, patch panels and all appurtenances necessary to provide fully operational network communications systems utilizing a UTP cabling topography. Coordinate all structured cabling with all trades and contractors prior to shop drawing submission.

### 3.4 ELECTRICAL POWER DISTRIBUTION

- A. Comply with all requirements of Specification Section 270500.
  1. All system power supplies serving system components or devices on the exterior of the facility shall be provided with the appropriate transient surge and suppression protection on both the line side as well as the load side. Refer to specification section 27 05 00 for additional requirements.
  2. Installation of all equipment and devices that pertain to other work in the contract shall be closely coordinated with the appropriate trade contractors.

### 3.5 TRANSIENT VOLTAGE SUPPRESSION

- A. Comply with all requirements of Specification Section 270500.

### 3.6 GROUNDING AND BONDING

- A. Comply with all requirements of Specification Section 270500.

### 3.7 EQUIPMENT IDENTIFICATION

- A. Comply with all requirements of Specification Section 270500.

### 3.8 MAINTENANCE & SERVICE

- A. Comply with all requirements of Specification Section 270500.

### 3.9 WARRANTY

- A. Comply with all requirements of Specification Section 270500
- B. Provide all manufacturers extended cable warranties based on matching wire to component compatibility requirements. All cable warranties shall be in effect for a period of not less than 20 years.
- C. The warranty must include the following statements regarding the cabling system:
  - 1. "That all communications networks have been certified and will support and conform to ANSI/TIA-568-C specifications covering any current or future application which supports transmission over a properly constructed and horizontal cabling system premises network which meets the channel and/or basic link performance as described in ANSI/TIA-568-C."
  - 2. "That all communications networks are free from defects in material or faulty workmanship."

### 3.10 FIELD SERVICES

- A. Comply with all requirements of Specification Section 270500

### 3.11 TRAINING

- A. Comply with all requirements of Specification Section 270500.
- B. Documentation:
  - 1. Contractor shall provide documentation to include all test results and as-built drawings, test results shall be computer generated and shall include all trace reports indicating each pair tested in accordance with all requirements of Specification Section 270500.
    - a. One Hard Copy shall also be provided to Owner and the Design Professional. Software for viewing the test results shall also be provided in the soft copy package.
- C. Final Acceptance
  - 1. Acceptance of all network communications systems, by Owner and the Design Professional, shall be based on the results of testing, functionality, and the receipt of documentation. The testing of all UTP cabling, fiber segments and all security and data network cables must meet the criteria established in the Specification Sections 270500.

2. The Contractor must demonstrate to Owner and the Design Professional that 1000 Mbps data signals can be successfully transmitted, bi-directionally, from the communications room patch panels to and from a minimum of 10% of individual data drops on each floor, witness tested by Owner and the Design Professional. The number of data drop locations to be tested shall be determined by Owner and the Design Professional. With regard to documentation, all required documentation shall be submitted to Owner and the Design Professional.

**D. As-Built Documentation:**

1. Contractor shall provide clean copies of the technology drawings depicting all as-built conditions for all data drop locations, cable routing and identification, patch panel, data switch port terminations, component layouts and all information as required by Division 01 specification section.

**END OF SECTION 27 11 00**

**SECTION 27 4100 - AUDIOVISUAL SYSTEMS**

**PART 1 - GENERAL**

**1.1 RELATED DOCUMENTS**

- A. Division 1 Specifications, General and Supplemental Requirements apply to this section with additions and modifications specified herein.
- B. Instructions to Bidders, Bidding Forms, Forms of Agreement between Owner and Contractor, Contract Award Date, Starting and Completion Dates, Conditions of the Contract, Insurance Requirements, and other Owner Requirements will be furnished separately by Owner. These documents, as well as any addenda issued, shall form a part of these Specifications, and this Contractor shall consult them in detail for instructions pertaining to his work.
- C. Each trade Contractor shall receive all drawings and specification sections issued as part of the overall bid package. All Contractors are to receive, review, and coordinate all of their work as shown or referenced on the other trade documents. All work shown or referenced on the other trade documents shall be included as part of the overall project scope for that particular discipline and trade.
- D. All other Division 27 Specifications.

**1.2 SUMMARY**

- A. These specifications and accompanying drawings are intended to cover the furnishing of all labor, material, and equipment and superintendence of the Audiovisual (AV) Systems.
- B. It is the intent and purpose of this specification and accompanying drawings to cover and include each item, all materials, machinery, apparatus, and labor necessary to properly install, equip, adjust, and put into perfect operation the respective portions of the installations specified and to so interconnect the various items or sections of the work as to form a complete and properly operating whole.
- C. Any equipment, apparatus, machinery, material, and small items not mentioned in detail, and labor not hereinafter specifically mentioned, which may be found necessary to complete or perfect any portion of installation in a substantial manner, and in compliance with the requirements stated, implied or intended in these specifications shall be furnished without extra cost. This shall include all materials, devices, or methods peculiar to the machinery, equipment, apparatus, or systems furnished and installed as part of the AV Systems work.
- D. Drawings and this Section outline the performance requirements of the AV system. The Drawings are diagrammatic in nature and are meant to convey the performance intent of the system. Contractor shall develop a solution for each portion of the AV system and submit detailed shop drawings and product datasheets to indicate the proposed approach.
- E. The following major system components may be specified under this section:
  - 1. Signal Switching Transport
  - 2. Controllers and Control Interfaces
  - 3. IP encoders, decoders and network hardware to support AV systems
  - 4. Signal Processing Systems

5. Signal Recording and Storage
6. Cabling and Connectors
7. Racks and Connection Panels
8. Displays
9. Projectors and Projection Screens
10. Collaboration Systems and Appliances
11. Collaboration and Event Cameras
12. Wireless Presentation System
13. Wired and Wireless microphone system
14. Loudspeakers

**1.3 PRODUCTS FURNISHED BUT NOT INSTALLED UNDER THIS SECTION**

- A. No products have been identified to be furnished but not installed.

**1.4 PRODUCTS INSTALLED BUT NOT FURNISHED UNDER THIS SECTION**

- A. Products installed but not furnished include all Owner Furnished Equipment (OFE) items which shall be configured and installed as part of a complete and working system as identified in the section summary.
- B. Refer to the audiovisual systems equipment list on the TA series drawing set for equipment identified as OFE.
- C. All Owner Furnished Equipment, with the exception of Room PCs imaged with Owner's standard user desktop profile, shall be maintained as part of the labor portion of the system warrantee.
1. Contractor shall assist in initial troubleshooting of Owner Furnished Equipment and if necessary, manage the equipment replacement process within the existing manufacturer warrantee period.
- D. New OFE Items
1. Contractor shall take receipt of any new equipment procured by Owner for this project, including Room PCs, Mini PCs, CATV Tuners, etc. as indicated in the Audiovisual Systems Equipment list.
    - a. If necessary for shop fabrication and testing, Contractor shall take receipt of equipment at Contractor's system staging location and transport the complete AV assemblies to the project site.
- E. Existing OFE Items:
1. No existing OFE equipment has been identified for this project.

**1.5 WORK NOT INCLUDED IN SCOPE**

- A. Contractor shall coordinate with associated trades providing all work outside of this scope which may be necessary for a complete and working system.
- B. Work not included in scope includes:

1. AV empty conduit, junction boxes, floor boxes, poke-thrus and other pathways for AV low voltage cabling unless otherwise specified in this section.
2. Display in-wall boxes.
3. Power receptacles supporting AV equipment.
4. AV furniture including tables, lecterns, and credenzas
5. Table hatches or table connectivity enclosures
  - a. Contractor to coordinate and provide all hatch and enclosure faceplates, connectors, and cabling.
6. Architectural or event lighting control interfaces
  - a. Contractor to coordinate and provide all cabling between AV and lighting controllers.
7. Owner network horizontal cabling and ports between an AV device and Owner's IDF/MDF/Network rack.
  - a. Contractor to coordinate and provide all patch cabling between Owner network drop termination points and AV devices including.
    - 1) Includes patch cabling run in glass front extrusions for use with room scheduling devices.
  - b. Contractor to coordinate and provide all network drops between AV devices or between an AV device and Contractor provided network switch.

**1.6 LAWS, REGULATIONS AND CODES:**

- A. Perform all work in strict compliance with all laws, regulations, and/or codes applying, including all Federal, State, and local codes and any other authority having jurisdiction. Wherever drawings or specifications conflict with such regulations they shall be made to conform, and approval of the Design Professional obtained on such changes as may be involved.
- B. All electrical and telecommunications work shall comply with the requirements of the National Electrical Code, latest accepted revision.

**1.7 PERMITS, FEES, AND CERTIFICATES OF APPROVAL:**

- A. Unless stated otherwise in General Conditions or Division 1, obtain, and pay for all permits, fees, and licenses required, including those of utilities and Agencies. Provide copies to Design Professional in the quantity requested. "Fees" shall include connection charges construction costs, and other such charges by utility companies or service providers. Ascertain such charges during bidding period and include bid price.

**1.8 REFERENCES**

- A. The publications list below form a part of this specification to the extent referenced. The publications are referred to in the text by basic designation only.

- B. Specific reference in specifications to codes, rules, regulations, standards, manufacturer's instructions, or requirements of regulatory agencies shall mean the latest printed edition of each in effect at the date of contract unless the document is shown dated.
- C. Conflicts:
  - 1. Between referenced requirements: Comply with the one establishing the more stringent requirements.
  - 2. Between referenced requirements and contract documents: Comply with the one establishing the more stringent requirements.
- D. References:
  - 1. General: The system shall comply with all applicable codes, ordinances and standards as interpreted and enforced by the local authority having jurisdiction.
  - 2. Avixa (Audiovisual and Integrated Experience Association, previously InfoComm) standards including:
    - a. Display Image Size for 2D Content in Audiovisual Systems
    - b. Cable Labeling for Audiovisual Systems
    - c. Audio Coverage Uniformity in Listener Areas
    - d. Standard Guide for Audiovisual Systems Design and Coordination Processes
    - e. Projected Image System Contrast Ratio
    - f. Audiovisual Systems Energy Management
    - g. AV Systems Performance Verification
    - h. Audio, Video and Control Architectural Drawing Symbols Standard
    - i. Electronic Symbol Files - Audio, Video and Control Architectural Drawing Symbols
  - 3. American Society for Testing and Materials (ASTM)
  - 4. ANSI standards including:
    - a. ANSI/TIA/EIA-568-B.1 Commercial Building Telecommunications Cabling Standard, Part 1: General Requirements
    - b. ANSI/TIA/EIA-568-B.3 Commercial Building Telecommunications Cabling Standard, Part 3: Optical Fiber Cabling Components Standard
    - c. ANSI/TIA/EIA-569-B Commercial Building Standard for Telecommunications Pathways and Spaces
    - d. ANSI/TIA/EIA-606-A The Administration Standard for the Telecommunications Infrastructure of Commercial Buildings
    - e. J-STD-607-A Commercial Building Grounding and Bonding Requirements for Telecommunications
    - f. ANSI/TIA/EIA-526-7 Measurement of Optical Power Loss of Installed Single-Mode Fiber Cable Plant
    - g. ANSI/TIA/EIA-526-14A Measurement of Optical Power Loss of Installed Multimode Fiber Cable Plant
  - 5. BICSI -- Telecommunications Distribution Methods Manual
  - 6. BICSI -- Cabling Installation Manual
  - 7. Underwriters Laboratories Listed, UL Certified
  - 8. National Electrical Code Articles 770 and 800.
  - 9. NFPA 780 - 2005 or newer.
  - 10. RUS Standards (formerly REA)
  - 11. Local State Uniform Fire Prevention and Building Code.
  - 12. Local State Department of Labor Rules and Regulations
  - 13. Local State Department of Health
  - 14. Code of Federal Regulations (CFR) [Telecommunications] Title 47 Part 90

15. Code of Federal Regulations (CFR) [Telecommunications] Title 47 Part 15

1.9 DEFINITIONS

- A. The term "Furnish" shall mean to obtain and supply to the job site. The term "Install" shall generally mean to fix in position and connect for use. Where language indicates that one party or trade is to "install", and another is to "connect", the term "install" shall mean only to fix in position, and "connect" shall mean to make electrical connections. The term "Provide" shall mean to furnish and install.
- B. ANSI – American National Standards Institute
- C. AV – Audio / Visual, audiovisual, audio visual
- D. Avixa - Audiovisual and Integrated Experience Association, formerly InfoComm
- E. HTML – HyperText Markup Language
- F. IP – Internet Protocol
- G. ISO – International Organization for Standardization
- H. NEC – National Electrical Code
- I. NEMA – National Electrical Manufacturing Association
- J. SNMP – Simple Network Management Protocol
- K. TCP – Transmission Control Protocol
- L. TIA – Telecommunications Industry Association
- M. UL – Underwriters Laboratories
- N. VLAN – Virtual Local Area Network
- O. VoIP – Voice over Internet Protocol
- P. VPN – Virtual Private Network

1.10 RECORD DRAWINGS:

- A. During construction keep an accurate record of all deviations of the work as shown on the drawings and that which is actually installed.
- B. Secure from the Design Professional a complete set of prints of the AV drawings and note changes thereon. Make a complete record in a neat and accurate manner, of all changes and revisions to original design which exist in completed work, in the file format originally received.
- C. The cost of furnishing above drawing files and preparing these record drawings shall be borne by the Contractor. When all revisions showing the work as finally installed are made, the corrected prints and drawings files shall be submitted for review and approval by the Design Professional.

- D. Record drawings shall be delivered to Owner within 30 days after acceptance of completed project by Owner.

**1.11 OPERATING INSTRUCTIONS:**

- A. Provide to Owner three bound copies of complete written instruction on the operation, care and maintenance of each piece of equipment and the installation as a whole. Include frequency of inspection, cleaning and adjusting and other attention as may be required in accordance with manufacturer's instructions. Material shall be manufacturer's brochures, catalog cuts, parts lists, wiring diagrams, etc. Also supply Owner with three complete sets of approved shop drawings.
- B. Furnish qualified personnel to instruct Owner's personnel in the maintenance and operation of all equipment and systems. Instructing personnel shall remain on the job continuously during working hours until such instruction is complete, but not less than 16 hours.

**1.12 PERFORMANCE REQUIREMENTS**

- A. Provide a complete, fully functional installation of the AV System and associated components including:
  - 1. Engineering and installation services aligning to the published project schedule.
  - 2. Coordination with Owner, Architect, Design Professionals, General Contractor and all associated trades.
  - 3. Creation, submission, and revision to the point of receiving approval of an AV Systems Submittals package.
  - 4. Equipment procurement.
  - 5. Equipment delivery to the site and removal of all trash.
  - 6. Provide all installation tools and materials necessary to complete all equipment installation tasks including ladders, scaffolding and lifts.
  - 7. Equipment installation.
  - 8. Systems setup, configuration, and commissioning.
  - 9. Systems demonstration to Owner and Design Professional.
  - 10. Remediation of any systems identified by Owner and Design Professional as not meeting published equipment specifications or the requirements as set out in this scope of work.
  - 11. As-built documentation.
  - 12. End User Training.
  - 13. AV Systems Warranty.
- B. Provide all equipment accessories, manuals, mounting hardware, remotes and other ancillary pieces furnished by the manufacturer but not required for installation.
- C. Provide all AV low-voltage cabling, connectors, connector plates, patch bays and patch cables.
  - 1. Confirm cable types and verify required length of all installed and portable premanufactured cables and assemblies prior to order.
- D. Terminate and test all AV low-voltage field connections.
  - 1. Provide all connectorized plates, connectors, cable labels and plate labels.
  - 2. Confirm finish of all plates and labels with Design Professionals.
- E. Install and configure Owner Furnished Equipment.

- F. Confirm color selection of all exposed AV equipment with Owner prior to order.
- G. Confirm required openings, recesses and mounting locations of all AV equipment to meet manufacturer requirements. Verify onsite prior to completion of wall framing and electrical rough-in.
- H. Contractor to include manufacturer onsite oversight labor including commissioning services and end user training for any systems which Contractor does not have staff with relevant manufacturer training and any available manufacturer certifications.
- I. Provision all video conferencing, wireless presentation and other collaboration hardware endpoints with Owner's network and collaboration system registration information.
- J. Coordinate AV equipment blocking requirements with the General Contractor prior to installing AV equipment.
  - 1. All wall or ceiling mounted equipment to be provided with hardware sized for a 5:1 safe working load limit.
  - 2. All ceiling mounted equipment to be provided with a safety cable or redundant support system attached to building structure and sized for the equipment by the equipment manufacturer.
- K. Install all AV rack hardware including rack bases and wall supports.
  - 1. Confirm that all AV rack locations will allow proper clearances.
  - 2. Coordinate with the General Contractor location of all AV rack power receptacles, data jacks, CATV jacks and empty AV low voltage junction boxes.
  - 3. Confirm sufficient heat exhaust and cooling systems have been provided to meet systems demand loads.
  - 4. Request of the General Contractor a normally-closed fire alarm mute contact for all event systems as identified in the Audiovisual Drawings.
  - 5. Provide rack hardware, cable management hardware and rack accessories as necessary to meet rack and equipment manufacturer recommended configurations.
- L. Provide all necessary copper and fiber patch cables for making all device interconnections. Patch cable type and color shall be coordinated with the structured cabling package to match project standards.
- M. Provide an AV equipment network coordination submittal for Owner completion. Configure all AV equipment with the confirmed network settings and test operation on Owner network.
- N. Loudspeakers
  - 1. Coordinate location of all wall and ceiling speaker systems including location of low voltage and power infrastructure.
  - 2. Review all ceiling speaker mounting conditions and provide ceiling speakers with a tile bridge or other relevant manufacturer support system.
  - 3. Where indicated in the specification, paint all exposed speaker grills with a custom color as confirmed by Owner.
- O. Furniture
  - 1. Coordinate with furniture providers all AV equipment installation requirements including cutout sizes, connector/plate openings, wiring openings, raceways, methods of affixing cables and equipment.

- a. All equipment and cabling shall be installed in a neat and professional manner with the intention of limiting visibility of supporting hardware and cabling.
  - b. All table cabling shall be secured to the table or hidden in a plinth, cloth wrap or articulating cable manager.
2. For all technical furniture provided under this scope of work, coordinate equipment layouts, and finishes with Owner and Design Professional prior to ordering.

**P. Wireless Systems**

1. Coordinate wireless frequency selection based on a site survey and relevant government agency requirements. Address any wireless channel conflicts prior to equipment ordering.
  - a. For meeting or event space wireless microphone and in-ear monitor systems, provide Owner with a system capable of adjusting wireless frequency as necessary to maintain reliable system operation in the installed environment.
2. Coordinate placement of wireless antennas and provide antenna splitting, combining and amplification as necessary to operate within manufacturer required signal strength ranges.

**Q. Control Systems**

1. Coordinate with the General Contractor the location of all external system interfaces including lighting, shades, occupancy, BMS as required.
  - a. Provide cabling between AV controllers and external system interfaces.
2. Provide custom AV control system code development as necessary to operate all AV equipment user controls per specification.
  - a. Manage a control interface confirmation process with Owner and Design Professional as outlined in the AV submittal requirements.
3. Configure all digital signal processors, content management systems, scheduling systems and other processor-based platforms to optimize to the spaces and systems being served.

**1.13 QUALITY ASSURANCE**

**A. Comply with the requirements of the following codes and/or standards:**

1. ANSI.
2. UL.
3. NEMA.
4. NFPA.
5. NEC.
6. IBC 2009.
7. BICSI.
8. ANSI/TIA 568-D Series.
9. ANSI/TIA 569-E.
10. ANSI/TIA 606-C.
11. ANSI/TIA 607-D.

**B. All packaged equipment shall be independently Third Party labeled as a system for its intended use by a Nationally Recognized Testing Laboratory (NRTL) in accordance with the OSHA Federal**

Regulations 29CFR1910.303 and .399, as well as NFPA Pamphlet #70 and National Electric Code (NEC), Article 90-7.

- C. The Contractor shall be certified by the manufacturer of the products, adhere to the engineering, installation and testing procedures, and utilize the authorized manufacturer components and distribution channels in provisioning this Project.
- D. All members of the installation team shall be certified by the manufacturer as having completed the necessary training to complete their part of the installation. Resumes of the entire team shall be provided along with documentation of completed training courses. Submit resume and copy of technician's license including:
  - 1. A Technical resume of the Contractor's Project Manager and Field Supervisor documenting a minimum of five (5) years of experience installing similar size projects.
  - 2. Matching documentation for any Sub-Contractor who will assist the Contractor in performance of this work.
- E. All hardware, software, firmware, and/or operating system requirements given are the minimum requirements. The Contractor's product shall meet or exceed these requirements. The product selected shall meet the operational, functional, and performance requirements specified herein.
- F. Manufacturer: Where Contractor has the ability to select a preferred manufacturer for items not specifically covered in the Appendix A Audiovisual Systems Equipment list, the manufacturing company selected shall have a minimum of five years of experience in producing the products.

#### 1.14 SUBMITTALS

- A. Contractor must receive approval from Owner or Design Professional of a submittal before procuring equipment or performing services related to the submittal.
- B. All submittals shall be provided in electronic format.
  - 1. Provide one full size paper submittal if requested by Owner.
  - 2. Confirmation of the submittal schedule and submission format must be obtained by Owner prior to creating individual submissions.
- C. Revised submittals shall include clouding or other method to indicate revisions since the prior submission.
- D. Project Status Report
  - 1. A project status report shall be sent to Owner and Design Professional weekly starting within two weeks of award. The project status report shall be used as the basis for Contractor coordination meetings and shall include:
    - a. Team member contact information
    - b. Project overall schedule
      - 1) Highlight changes to the schedule since last issuance
      - 2) Identify critical schedule items
      - 3) Identify opportunities to improve on the current schedule
    - c. Action items from prior coordination meeting and status of each item
    - d. Installation schedule and status for each unique space or system in the project.

- e. Outstanding Owner coordination items.
  - f. Outstanding Design Professional coordination items.
  - g. Change Order Status
  - h. Submittal Approval Status
- E. Within five business days of award, submit an installation schedule including major milestone dates for construction phasing based on overall project construction schedule (along with separate phases where applicable), system and device configuration, testing and training. Include the following milestones:
  - 1. Separate milestones for each submittal.
  - 2. Signage content and system configuration coordination session.
  - 3. Required date for receipt of all OFE equipment per project phase or equipment type.
  - 4. Required data for receipt of any Owner furnished signage content
  - 5. AV project manager onsite.
  - 6. Delivery of all Furnished but not Installed equipment to site
  - 7. Cable pulls start and complete
  - 8. Mount and speaker installation start and complete
  - 9. Equipment installation start and complete
  - 10. Systems configuration and testing start and complete
  - 11. Systems ready for checkout and punch list
  - 12. Owner training
  - 13. As-built submission
- F. Within 30 business days of award submit an AV infrastructure review memo confirming infrastructure shown on the AV, Architectural, Telecom, Mechanical and Electrical design packages meets AV equipment installation requirements or identifying specific adjustments necessary to support the specified AV equipment.
  - 1. Verify AV conduit sizing and pathways
  - 2. Verify architectural recesses and ADA clearances
  - 3. Verify data drops to support AV network connectivity
  - 4. Verify AV power receptacles and multi-discipline shared services device requirements (in-wall boxes, floor boxes, poke-thrus.
  - 5. Verify AV enclosure cooling/exhaust
  - 6. Verify ceiling device layouts and clearances, projector, and projection screen orientation
- G. Qualifications: The Contractor shall submit qualification data sheets for firms and persons as specified in the "Quality Assurance: section of this specification to demonstrate their capabilities and experience.
- H. Submit proposed product data sheets: The Contractor shall submit catalogue cut-sheets that include manufacturer, trade name, and complete model number for each product specified or selected for use in the project.
  - 1. Model number shall be highlighted to indicate exact selection per system type.
  - 2. Product data sheets shall be organized with separate folders per system type with a master equipment list broken into three sections:
    - a. System types and quantities of systems
    - b. Equipment and equipment quantities per system type
    - c. Master project equipment list and quantities
  - 3. Confirm manufacturer master quote numbers and the accuracy of the master quotes against the specified equipment.

- I. Submit shop drawings detailing proposed system architecture and interconnectivity.
  - 1. All shop drawings sheets shall be sized to match the project architects drawing format.
  - 2. Shop drawings shall include the following drawing information.
    - a. Scaled floorplans indicating the area of work and room types.
    - b. Enlarged plans indicating equipment locations, mounting requirements, clearances, infrastructure requirements, and cable routing.
      - 1) Provide projector and projection screen throw distance calculations.
      - 2) Provide display elevations and sections.
      - 3) Identify any details which do not meet minimum ADA clearance requirements.
      - 4) Identify equipment centerline coordinated with furniture and main display wall.
    - c. Device details indicating mounting requirements for each unique equipment type in the project.
      - 1) All overhead equipment details must identify the safe working load and manufacturer provided safety hardware. Where a custom mounting detail is required using fabricated components or components provided by multiple manufacturers a structural detail, reviewed and stamped by a Structural Engineer license in the project state, must be provided.
      - 2) Copies of manufacturer cut sheet details shall not be considered sufficiently coordinated.
    - d. Rack elevations and mounting details with clearances and infrastructure requirements
    - e. System flow diagrams with cable labels and corresponding cable schedule indicating wiring interconnections between all AV devices and Owner's network.
    - f. Wiring termination details.
      - 1) Include cable labelling standards and materials
    - g. Panel details showing all prefabricated and custom connector panels, connector types, labels and required backbox.
    - h. Technical Furniture details indicating the location, required openings and cable management of all AV equipment in furniture and millwork regardless of what scope the furniture is provided under.
- J. Control Systems
  - 1. Owner or Design Professional approval of all Control Systems submittals is required prior to installation. Failure to secure approval shall not be grounds for project schedule delay or Contractor change order.
  - 2. Submit button panel layouts with labelling/engraving and sequence of operations.
  - 3. Submit audio DSP configuration files.
  - 4. Submit an initial and up to two revised set of touch panel user interface submittals.
    - a. Contractor shall lead a user interface review session with Owner and Design Professional prior to start of touch panel user interface design. Contractor shall provide up to three design samples in advance of the user interface session for Owner and Design Professional review.

- b. User interface layouts shall follow the best practices laid out in the InfoComm *Dashboard for Controls*
- c. The overall user interface design process shall reflect the current draft Avixa UX 701.01 *User Experience Design for AV* recommendations
- d. User interfaces shall include the following basic features:
  - 1) Control of all local AV equipment addressable parameters required during the specified use cases.
  - 2) Call controls, transport controls, source selection, volume controls as appropriate.
  - 3) Standard controls formatted to match industry standard applications (knobs, sliders, buttons, interactive menus, etc.)
  - 4) A password protected advanced section allowing for control of individual device parameters (power, channel level controls, input selection, etc.)
  - 5) Utilize stock manufacturer pages and capabilities where possible. Custom scripting shall be avoided unless where required as part of this specification.

**K. Network Coordination Submittal**

- 1. Submit a detailed list of all network enabled AV devices detailing:
  - a. MAC address
  - b. IP Address (for Owner to complete)
  - c. Subnet (for Owner to complete)
  - d. Wired and Wireless VLANs
  - e. DHCP requirement
  - f. Unique network requirements including firewall exceptions, port forwarding and Qos
- 2. Lead an AV network coordination session with Owner and Design Professional to confirm overall project AV network requirements and set a schedule for completion and return of the Network Coordination Submittal by Owner.

**L. Owner Training Plan**

- 1. Identify specific systems to be trained on and training durations.
- 2. Identify required project stakeholders.
- 3. Identify training status and provide training sign-off sheets.
- 4. Provide training materials and user one-page operations sheets for each system types.

**M. Operations and Maintenance Manuals:**

- 1. This Section requires complete documentation of the AV System for the purpose of system operation and maintenance during and after the Warranty period. It is intended that the operation and maintenance manuals be exhaustive in the coverage of the system to the extent that they may be used as the sole guide to the troubleshooting, identification, and repair of defective parts. All documentation, as described here-in shall be submitted to Owner for approval sixty (60) days prior to final submission.
- 2. Scope: These manuals shall include basic wiring diagrams, schematics, and functional details such that any component, wire, or piece of equipment in the system may be easily identified by going to the actual equipment and making reference to this manual. It is required that everything in the system be neatly labeled and easily identifiable. Every terminal, wire, component, or piece of equipment, and other such items shall have a

number or letter designation. All of these identification characteristics shall be included in the maintenance and operation manuals.

3. The maintenance manual requirement of this Section is in addition to Shop Drawing requirements. Maintenance manuals and Drawing sets shall be compiled after system fabrication and testing and shall incorporate any changes made after Shop Drawing submittal. The maintenance manuals and drawing books shall be permanently bound in hard plastic covers.
4. Maintenance Manuals, Manufacturer's Literature: Provide manufacturer's standard literature, covering all equipment included in the system. The maintenance manuals shall contain specifications, adjustment procedures, circuit schematics, component location diagrams, and replacement parts identification. All references to equipment not supplied on this Project shall be crossed out.
5. System Administrator Documentation: This documentation shall provide complete information on the configuration, business rules, operation, maintenance, and troubleshooting of the system.

**N. Testing Plan**

1. Submit a systems testing and verification plan for approval by Owner and Design Professional.
2. The approved Testing Plan shall be completed and provided to Owner and Design Professional prior to commencement of Owner testing and punch list efforts.

**O. As-Built Documentation**

1. Submit an updated version of all submittals revised to match installed conditions.
2. Submit the native version of all drawing, control programming, digital signal processing and other systems configuration files.

**P. Warranty**

1. Within 30 business days of award, provide a summary of the systems warrantee including all optional services for final Owner confirmation.
2. At time of as-built documentation submission provide two physical copies of the hardware and software warranty certifying that the final as-built installation is fully warranted by the manufacturer.

**1.15 GENERAL WARRANTY**

- A. The system warranty shall commence on the date of Substantial Completion unless otherwise provided for in the Contract.
- B. The system warranty shall be for a period of one year
- C. Hardware Warranty:
  1. Contractor shall warrant that all components meet or exceed the specifications provided in the product data submittal.
  2. The Contractor shall warrant that the proposed merchandise will conform to its description and any applicable specifications and shall be of good quality for the known purpose for which it is intended.
  3. The warranty shall cover material and labor for the replacement or repair of defective products.

4. Regardless of manufacturer warranties expiring before the full system warranty period, Contractor shall be responsible for extending any manufacturer warranties for the full length of the system warranty.

D. Software Warranty:

1. The warranty shall allow for replacement or repair at the discretion of Owner. All software necessary to compile, modify, and maintain software developed for this specification shall be included in this warranty.
2. The warranties shall include the price of all software upgrades during the warranty period. If a new version of the system software becomes available during the warranty period, it shall be upgraded as part of the warranty.

1.16 MAINTENANCE AND SUPPORT SERVICES

- A. Description of Work: During the warranty period provide customer service for subscriber issues Monday – Friday, 9am – 5pm local time. Provide quarterly system inspections, checks and updates during the warranty and maintenance period.
- B. Personnel: Service personnel shall be certified in the maintenance and repair of similar types of equipment and qualified to accomplish work promptly and satisfactorily. Service personnel shall hold a valid Airport security credential. Owner or Owner's Designated Representative shall be advised in writing of the name of the designated service representative, and of any change in personnel.
- C. Schedule of Work: The Contractor shall perform quarterly inspections of the installed system. Inspections shall be in accordance with manufacturer and Contractor recommendations. The adjustment and repair of the system shall include visual checks of installed equipment and inspection of system health logs and software. Recommended software updates shall be applied on the system at these pre-defined quarterly periods.
- D. Scheduled Work: Scheduled work shall be performed during regular working hours, Monday through Friday, excluding holidays.
- E. Emergency Service: Owner will initiate service calls when the system is not functioning properly. Qualified personnel shall be available to provide service to the complete system repair. Owner shall be furnished with a telephone number where the service supervisor can be reached at all times. Service personnel shall be at site within 4 hours after receiving a request for service. The system shall be restored to proper operating condition within 8 hours after service personnel arrive onsite.
- F. Records and Logs: The Contractor shall keep records and logs of each task, and shall organize cumulative records for each component, and for the complete system chronologically. A continuous log shall be maintained for all devices. The log shall contain all initial settings. Complete logs shall be kept and shall be available for inspection on site, demonstrating that planned and systematic adjustments and repairs have been accomplished for the system.
- G. Work Requests: The Contractor shall separately record each service call request, as received. The form shall include the serial number identifying the component involved, its location, date and time the call was received, specific nature of trouble, names of service personnel assigned to the task, instructions describing what has to be done, the amount and nature of the material to be used, the time and date work started, and the time and date of completion. The Contractor shall deliver a record of the work performed within 5 days after work is accomplished.

- H. System Modifications: The Contractor shall make any recommendations for system modification in writing to Owner. System modifications shall not be made without prior approval of Owner. Any modifications made to the system shall be incorporated into the operation and maintenance manuals, and other documentation affected.

- I. Spare Equipment:

- 1. Provide spare equipment where indicated in the 27 41 00 Appendix A.

**1.17 DELIVERY, STORAGE, AND HANDLING**

- A. Audiovisual Equipment waiting install onsite shall be maintained in a secure storage area. Contractor and is responsible for the safe delivery, storage and handling of all equipment covered in this scope of work through substantial completion of the work.

**1.18 PROJECT CONDITIONS**

- A. Environmental Limitations: System components shall be equipped and rated for the environments where installed.
- B. Environmental Conditions: Capable of withstanding the following environmental conditions without mechanical or electrical damage or degradation of operating capability:
- C. Interior, Controlled Environment: System components shall be rated for continuous operation in ambient conditions of 2 to 40 deg C dry bulb and 20 to 90 percent relative humidity, noncondensing.
- D. Interior, Uncontrolled Environment: System components installed in non-air-conditioned interior environments shall be rated for continuous operation in ambient conditions of 0 to 122 deg F (minus 18 to plus 50 deg C) dry bulb and 20 to 90 percent relative humidity, noncondensing.
- E. Verify that field measurements are as shown on Drawings; no media, fiber, or copper, shall be installed in lengths surpassing Standards based length requirements.
- F. Wire and cable routing shown on Drawings is approximate unless dimensioned. Route wire and cable as required to meet Project conditions.
- G. Where wire and cable routing is not shown, and destination only is indicated, determine exact routing and lengths required. Record actual routing on as-builts for all conduit larger than one inch.

**1.19 PROJECT COORDINATION**

- A. Determine required separation between cable and other work.
- B. Coordinate cable routing to avoid interference with other work disciplines.
- C. Coordinate grounding and bonding with Section 270527 Contractor.
- D. Coordinate use of fiber optic cabling infrastructure with Section 271310 Contractor.
- E. Coordinate network configuration requirements with Section 272000 Contractor.

## PART 2 - PRODUCTS

### 2.1 AUDIOVISUAL SYSTEMS EQUIPMENT LIST

- A. Refer to the TA series drawings audiovisual systems equipment list for product information.

### 2.2 SUBSTITUTIONS

- A. Contractor requests for substitutions shall be made in writing and shall include:
  - 1. The equipment or process requested for substitution and a summary of the reason for substitution.
  - 2. The requested equipment or process to substitute with and a feature comparison with the base scope of work.
  - 3. Proposed cost and schedule impacts.
- B. No substitution shall be allowed without written approval of Owner or Design Professional.
- C. Cost and schedule impacts will only be considered for approval in the event that the substitution is due to factors outside of the control of the Contractor.

## PART 3 - EXECUTION

### 3.1 GENERAL

- A. Contractor shall install all system components including furnished equipment, and appurtenances in accordance with the manufacturer's instructions, and shall furnish all cables, connectors, terminators, interconnections, services, and adjustments required for a complete and operable system.
- B. Grounding shall be installed as necessary to preclude ground loops, noise, and surges from adversely affecting system operation.
- C. Contractor shall adhere to the following during installation of the system:
  - 1. Underwriters Laboratories (UL) listing for restricted access installations in business and customer premises applications. This listing is required by the National Electric Code for customer premise installations.
  - 2. Fire resistance requirements specified by Underwriters Laboratories in UL 1459, 2nd edition.
- D. Where undefined by codes and standards, Contractor shall apply a safe working load of at least five (5) times the rated load to all fastenings and supports of system components.
- E. The Contractor shall adhere to the installation schedule of the General Contractor and should attend all construction meetings scheduled by the General Contractor.
- F. Contractor shall place materials only in those locations that have been previously approved. Any other locations shall be approved, in writing, by Owner.
- G. All wiring and cables shall be properly dressed and/or bundled with Velcro straps. Twisted wire, tape, rope, twine, phone wire and similar bits of debris usually available on site are not acceptable

substitutes for proper securing hardware. All inter-rack cables and wiring must be properly routed, and where available, run in cable trays. Overhead cables must be easily removed or reworked within the cable trays. Proper care must be taken to ensure that new cables added to the trays are not stressed or intertwined with existing cables. Overhead cables may not cross perpendiculars or be suspended in mid-air without supports. No supports may be installed without prior approval from Owner. All long cable runs must be properly identified at each end and every 100 feet indicating the carried frequency and communication room of origin. All cabling within the building must be cut to proper length.

- H. The Contractor shall obtain written permission from Owner before proceeding with any work which requires cutting into or through any part of the building structures such as, but not limited to, girders, beams, concrete, carpeted or tiled floors, partitions or ceilings. The Contractor shall also consult with the General Contractor before cutting into or through any part of the building structures where fireproofing or moisture proofing could be impaired.

### 3.2 INSTALLATION

- A. System equipment shall not be installed until the environment is free of dust. A dust-free environment shall be considered one in which all construction work has been completed and the air handling system for the area has been operated continuously for at least two weeks with a filter change after one week. During and following installation of the system equipment, relay assemblies and equipment cabinets, the air handling system shall be kept operational continuously and shall be adjusted to maintain a positive pressure relative to building spaces outside the areas of installation. Openings into the installation spaces shall be kept closed, filters shall be changed at frequent intervals, equipment enclosures shall be kept closed, covers shall be installed and any other provisions for keeping the equipment, assemblies, and cabinets clean and free of dust and deliver shall be employed.
- B. Verify exact location and sizes of all conduit runs and back boxes prior to rough-in.
- C. All switches, connectors, outlets, etc. shall be clearly, logically, and permanently labeled during installation.
- D. All items of equipment related to the AV system shall be installed in the designated positions as defined on the drawings.
- E. All wiring terminations shall be trimmed to the required length for proper system operation and neatly dressed. No excess wire loops shall remain in the final system unless required for maintenance access. Each system wire and cable shall be clearly marked at each end.
- F. All audio and video interconnections shall use the highest quality signal path available.

### 3.3 WIRING

- A. Wiring within equipment enclosures shall be neatly grouped or tied or run in plastic snapcover wireway sections. All connections to panel mounted devices shall employ compression attached full 360° ring type or 'push-on' type terminators securely fastened to the device terminals. Wiring shall run behind the panel in a manner that is not visible from the operator's position. A 3" termination loop shall be formed immediately adjacent to each terminal.
- B. Terminal strips shall be fully insulated but allow insertion of test equipment probes. Each terminal segment shall be numbered to correspond with the drawings and conductor identification numbers.

- C. All wire and cable shall extend to each outlet location with complete electrical continuity and without any shorts or grounds. Cables shall run uninterrupted and un-spliced to each remote device.
- D. Cables shall be routed so as to maintain a separation of at least 2 feet from all heat sources and from ballasts, transformers, dimmers and all other sources of electromagnetic interference.
- E. Care shall be exercised during installation not to damage the cable insulation. Damaged cables shall be removed and replaced.
- F. Each cable termination shall be tagged and labeled.
- G. Wire color coding for all AV cabling shall be at the option of the Contractor, but each individual conductor shall be the same color throughout its entire length.
- H. After testing is complete, audio levels on all systems shall be set to levels satisfactory to Owner.

### 3.4 SYSTEM CONFIGURATION

- A. Contractor shall provide for configuration of all devices and software into a complete and fully operational AV System.
  - 1. All configuration files shall be provided to Owner as part of the close-out package
    - a. Contractor shall maintain Ownership of any custom software files.
    - b. Contractor shall extend to Owner a perpetual license for use and modification of any custom software files when used with systems provided as part of this scope of work.
- B. During the installation phase of the project, the Contractor shall work with Owner to establish the baseline configuration requirements for the different AV elements.

### 3.5 CONFIGURATION REQUIREMENTS

- A. An IP Addressing Plan shall be coordinated, developed, and finalized with Owner and submitted for approval prior to implementation.
- B. VLAN(s) shall be configured to support the LAN and as identified during Owner network coordination efforts.
- C. Configure AV devices for centralized management via an Owner provided workstation connected to the network. Configuration and management software for the various network components shall be installed on the workstation. Training shall include management of the AV devices via the management workstation.

### 3.6 TESTING

- A. Project Testing: The overall Audio Visual Systems shall not be considered complete until On-Site Testing is completed. The purpose is to test the complete system and demonstrate that all specified features and performance criteria are met. All requirements of the specification shall be tested.

- B. Contractor shall follow the Avixa/ANSI 10:2013 *Audiovisual Systems Performance Verification* testing and documentation process and submit a completed testing plan prior to final Owner and Design Professional testing.
  - 1. Design Professional may elect to request retesting of individual rooms following the Avixa/ANSI 10:2013 standard until satisfied that systems are properly installed and configured.
- C. For any system or equipment types not covered in the Avixa/ANSI 10:2013 standard, Contractor shall provide the proposed test plan/procedures for each testing phase for review by Owner or Design Professional. The test plan for each phase of testing shall detail the objectives of all tests. The tests shall clearly demonstrate that the system and its components fully comply with the requirements specified herein. The submission of Test Plans shall adhere to the following:
  - 1. A draft test plan shall be presented to Owner at least forty-five (45) days prior to the scheduled start of each test.
  - 2. A workshop for reviewing comments shall be conducted with Owner at least thirty (30) days prior to the scheduled start of each test.
  - 3. A final test plan shall be submitted to Owner at least fourteen (14) days prior to the scheduled start of each test.
  - 4. Test plans shall contain at a minimum:
    - a. Functional procedures including use of any test or sample data.
    - b. Test equipment is to be identified by manufacturer and model.
    - c. Interconnection of test equipment and steps of operation shall be defined.
    - d. Expected results required to comply with specifications.
    - e. Testing matrix referencing Specification requirements with specific test procedures.
    - f. Record of test results with witness initials or signature and date performed.
    - g. Pass or fail evaluation with comments.
- D. The test procedures shall provide conformity to all Specification requirements. Satisfactory completion of the test procedure is necessary as a condition of system acceptance.
- E. All Test plans must be reviewed by Owner. To successfully complete a test, the test document must be signed and dated by both the Contractor and Owner.
- F. Owner will review, witness and validate the execution of all formal test procedures prepared by the Contractor and deliverable under the contract to assure the tests cover all requirements and that there is a conformity between the conducted test, the test results and Specification requirements.
- G. Documentation verification both interconnects and operationally, shall be part of the test. Where documentation is not in accordance with the installed system interconnect and operating procedures, the system shall not be considered accepted until the system and documentation correlate.
- H. The Contractor shall provide Owner or Owner representative the opportunity to participate in any or all of tests.
- I. Test Reports: The Contractor shall prepare, for each test, a test report document that shall certify successful completion of that test. Submit to Owner's representative for review and acceptance within seven (7) days following each test. The test report shall contain, at a minimum:
  - 1. System power measurement results and settings

2. Commentary on test results
3. A listing and discussion of all discrepancies between expected and actual results and of all failures encountered during the test and their resolution.
4. Complete copy of test procedures and test data sheets with annotations showing dates, times, initials, and any other annotations entered during execution of the test.
5. Signatures of persons who performed and witnessed the test
6. Test Resolution: Any discrepancies or problems discovered during these tests shall be corrected by the Contractor at no cost to Owner. The problems identified shall be corrected and the percentage of the entire system re-tested determined by Owner before any subsequent testing is performed.

### 3.7 CLEANING

- A. Remove all unnecessary tools and equipment, unused materials, packing materials, and debris from each area where work has been completed unless designated for storage.

### 3.8 TRAINING

- A. The Contractor shall provide a minimum of two hours of onsite training per space type with Owner specified trainees. Training may be broken into two categories with dedicated sessions for each; technical and operational.
  1. Technical training includes Owner's technical or administrative staff and is intended to cover overall space functionality, infrastructure, individual equipment operation, preventative maintenance and troubleshooting.
  2. Operational training includes Owner's users or day-to-day administrative staff and is intended to cover overall space functionality, a walkthrough of typical use cases and troubleshooting.
- B. The Contractor shall provide the trainees with detailed as-built information. The training shall provide trainees with a working knowledge of the system design and layout, ability to configure and monitor the system, and troubleshooting methods and techniques. In addition, the training shall cover testing, maintenance, and repair procedures for all equipment and applications, which are provided under this Specification.
- C. Course materials shall be delivered to Owner. Final delivery of the course materials shall include a master hard copy of all materials and an electronic copy in a format reviewed in advance by Owner. The Contractor shall supply a video recording of each training course.
- D. All training shall be completed a minimum of two weeks prior to the system becoming operational and utilized by Owner. Training schedule subject to Owner's review.

### 3.9 ACCEPTANCE

- A. Acceptance will be withheld until the following have been completed successfully:
  1. Acceptance of all submittals
  2. Delivery of final documentation
  3. Successful testing
  4. Completion of training
  5. Demonstrate system to designated Owner personnel as required by applicable sections of these specifications. Use submitted operation and maintenance manual as reference

during demonstration and training. Demonstrate as-built records are in format required and can lead troubleshooting technicians to port level of detail in field.

END OF SECTION

**SECTION 27 52 23  
NURSE CALL/CODE BLUE SYSTEMS**

**PART 1 - GENERAL**

**1.1 STIPULATIONS**

- A. The specifications sections "General Conditions of the Construction Contract", "Special Conditions", and "Division 1 - General Requirements" form a part of this Section by this reference thereto and shall have the same force and effect as if printed herewith in full.
- B. Related Sections:
  - 1. Division 07 – Through-Penetration Firestop Systems
  - 2. Division 26 – Common Work Results for Electrical
  - 3. Division 26 – Low-Voltage Electrical Power Conductors and Cables
  - 4. Division 26 – Grounding and Bonding for Electrical Systems
  - 5. Division 26 – Hangers and Supports for Electrical Systems
  - 6. Division 26 – Box and Covers for Electrical Systems
  - 7. Division 26 – Surface Raceways for Electrical Systems
  - 8. Division 26 – Identification for Electrical Systems
  - 9. Division 27 – General Requirements for Telecommunications
  - 10. Division 27 – Common Work Elements for Communications Systems
  - 11. Division 27 – Network Communications Systems
  - 12. Division 27 – Two-Way Communications System
  - 13. Division 27 – Audiovisual Systems
  - 14. Division 27 – Nurse Call/Code Blue
  - 15. Division 28 – Common Work Elements for Electronic Safety and Security
  - 16. Division 28 – Physical Electronic Safety and Security
  - 17. Division 28 – Video Surveillance System
- C. Section includes visual/tone nurse-call system.

**1.2 ACTION SUBMITTALS**

- A. Product Data: For each type of product indicated.
- B. Shop Drawings: Include plans, elevations, sections, details, and attachments to other work.
  - 1. Equipment cabinets.
  - 2. Cabling diagrams.
  - 3. Station installation details.

**1.3 INFORMATIONAL SUBMITTALS**

- A. Field quality-control reports.
- B. Sample warranty.

1.4 CLOSEOUT SUBMITTALS

- A. Operation and maintenance data.

1.5 QUALITY ASSURANCE

- A. Installer Qualifications: Manufacturer's authorized representative who is trained and approved for installation of units required for this Project.
- B. Compatibility: System shall be capable of integration with any brand of phone system (wired or wireless), staff locating system, CCTV, and fire-alarm system.
- C. Electrical Components, Devices, and Accessories: Listed and labeled according to UL 1069 as defined in NFPA 70, by a qualified testing agency, and marked for intended location and application.

1.6 SOFTWARE SERVICE AGREEMENT

- A. Technical Support: Beginning with Substantial Completion, provide software support for 2 years.
- B. Upgrade Service: Update software to latest version at Project completion. Install and program software upgrades that become available within 2 years from date of Substantial Completion. Upgrading software shall include operating system. Upgrade shall include new or revised licenses for use of software.
- C. Provide 30 days' notice to Owner to allow scheduling and access to system and to allow Owner to upgrade computer equipment if necessary.

**PART 2 - PRODUCTS**

2.1 NURSE-CALL SYSTEM GENERAL REQUIREMENTS

- A. Station Zones: Able to program 256 station zones for each master station in the network with a minimum of 8 priority levels and addressable visual and audible annunciation of audible devices such as smoke detectors and door contacts.
- B. System shall provide integrated and centralized "Code Blue" and "Staff Emergency" calls.
- C. Expansion Capability: Equipment ratings, housing volume, spare keys, switches, relays, annunciator modules, terminals, and cable conductor quantities adequate to increase the number of stations in the future by 25 percent above those indicated without adding internal or external components or main trunk cable conductors.
- D. Resistance to Electrostatic Discharge: System, components, and cabling, and the selection, arrangement, and connection of materials and circuits, shall be protected against damage or diminished performance when subjected to electrostatic discharges of up to 25,000 V in an environment with a relative humidity of 20 percent or less.

- E. Equipment: Microprocessor, electronic, modular.
- F. Master Nurse-Call Station: Programmed via a PC.
- G. Wall-Mounted Component Connection Method: Components connect to system wiring in back boxes with factory-wired plug connectors.
- H. Telephone Interface: Permit use of wired and wireless telephones to execute nurse-call master station functions.
- I. Third-Party Pager Interface: Programmable to send tone, numeric, and alphanumeric message to pocket pagers or personal digital assistants and to use industry standard-protocol, RS-485 interface.

## 2.2 VISUAL/TONE NURSE-CALL SYSTEM

### A. Operational Requirements:

1. Patient Station Call: Lights a steady call-placed lamp on the station, steady lamps in the zone light and corridor dome light associated with the patient's room, and steady lamps at the central annunciator and other system display devices and displays message on master and staff/duty stations. At the same time, it sounds a programmed tone at intervals, at the respective annunciator and master and staff/duty stations. Legends at the central annunciator and master station identify the calling station.
2. Pull-Cord-Call Station Call: Flashes a call-placed lamp on the station and distinctive-color lamps in the zone light and corridor dome light and at the central annunciator and staff/duty stations. At the same time, it sounds a programmed tone at intervals, at the central annunciator and master and staff/duty stations. A legend at the master station identifies the calling station, priority as programmed, and bed identification.
3. Emergency-Call Station Call: Produces the same responses as pull-cord-call station calls except rapidly flashing red emergency digital display and tone repetition rates are more frequent, tone frequency is higher, and lamps in the zone light and corridor dome light are a different color. Indicator lamps may be turned off and the system reset only at the calling station. Displays message on pocket pagers, sounds programmed tone on phones, and displays message on display equipped phones.
4. System Reset: Operating reset button at the originating station cancels signals associated with the call. Illuminates a green digital display on the patient station and log presence on the master station.
5. Cord-Set Removal: Initiates a patient station call when the cord set is removed from the jack in the patient station faceplate. Displays location and "cord removed" message on master station, pocket pagers, and display equipped phones. Inserting a cord-set plug or a dummy plug into the jack and operating the station reset button resets the call.
6. Patient Control Unit: Controls entertainment volume and channel selection. Nurse button on the unit initiates a patient station call. Integral speaker reproduces entertainment sound.
7. Emergency Bath Station Call: Illuminates the digital display on the emergency bath station; rapidly flashes white dome lamp; displays location, priority, and bath on master station; and sounds programmed tone on master station display equipped phones and pocket pagers.

8. Staff/Duty Station Operation: Operation shall be identified to patient station except the message staff shall display on all devices when the staff call button is activated.
9. Privacy Key Activation: When privacy key is activated on patient station, the system shall disconnect the patient station microphone and slowly flash yellow privacy digital display on the patient station. Displays "privacy" on master station when selecting this room/bed.

**B. Central Annunciator:**

1. Lamp type.
2. Lamp Legends: Machine lettered and legible from a distance of at least 48 inches when a call is present. Legend shall identify initiating station and priority of call.
3. Power-on Indicator: Digital, or push-to-test switch.
4. Audible Signal: Electronic tone.

**C. Central Equipment Cabinet:**

1. Lockable metal.
2. Houses power supplies, controls, terminal strips, and other components.
3. Power-on indicator lamp.

**D. Single-Patient Station: Call-placed lamp, reset push button, and polarized receptacle matching cord-set plug; mounted in a single faceplate.**

**E. Staff/Duty Stations: A minimum of two call lamps, one for routine calls and one for emergency calls; and an audible tone signal device.**

**2.3 SYSTEM COMPONENTS**

**A. Emergency-Call Station: Locking-type push button, labeled "Push to Call Help"; reset trigger to release push button and cancel call; and call-placed lamp, mounted in a single faceplate.**

**B. Emergency-Bath Station:**

1. Consists of a sliding, chemical-resistant, ABS red fascia marked with the word "URGENT" in bold letters.
2. Capable of being activated with nylon pull cord or by sliding the face of the unit downwards.
3. Activation of the station shall illuminate a reassurance digital display on the face of the unit in addition to notifying the master station.
4. Water resistant and able to withstand routine cleaning and chemical disinfectants.
5. Uses magnetic reed switch technology for reliability and corrosion resistance.
6. Mounts on a single-gang electrical box wire to the respective patient station or input controller.

**C. Staff, Emergency Station:**

1. Consists of a sliding, chemical-resistant, ABS red fascia marked with the word "EMERGENCY" in bold letters.

2. Capable of being activated with nylon pull cord or by sliding the face of the unit downwards.
  3. Activation of the station shall illuminate a reassurance digital display on the face of the unit in addition to notifying the master station.
  4. Mounts on a single-gang electrical box wire to the input controller.
- D. Pull-Cord-Call Station:
1. Pull-Down Switch: Lever-locking type, labeled "Pull Down to Call Help."
  2. Reset trigger.
  3. Call-placed lamp.
  4. Water-resistant construction.
- E. Patient Control Unit:
1. Equipped with plug and 96-inch long white cord.
  2. Ethylene oxide, sterilizable.
- F. Pillow Speakers:
1. Eight-conductor, DIN, flexible PVC jacketed cable.
  2. Contain nurse-call button, volume control, speaker, and channel control in molded flame-retardant ABS housing.
  3. Cord: 96 inches long with sheet clip.
- G. Call-Button Plug:
1. Designed to plug into patient station cord-set receptacle.
  2. Button switches call circuit.
  3. Two plugs for every 10 patient beds.
- H. Dummy Plugs:
1. Designed to plug into patient station cord-set receptacle when call-button plug or patient cord set is not used.
  2. Three plugs for every 10 patient beds.
- I. Indicator Lamps: Digital type with rated life of 20 years unless otherwise indicated.
- J. Station Faceplates:
1. Stainless steel, a minimum of 0.0375 inch thick.
  2. Finish: Brushed.
  3. Machine-engraved labeling identifies indicator lamps and controls.
- K. Corridor Dome Lights and Zone Lights:
1. Three-lamp signal lights.
  2. Lamps: Front replaceable without tools, low voltage with rated life of 7500 hours. Barriers are such that only one color is displayed at a time.

3. Lenses: Heat-resistant, shatterproof, translucent polymer that will not deform, discolor, or craze when exposed to hospital cleaning agents.

L. Cable:

1. Conductors: Jacketed single and multiple, twisted-pair copper cables.
2. Sizes and Types: As recommended by equipment manufacturer.
3. Cable UL-Listed and labeled for plenum installation.

M. Grounding Components: Comply with requirements in Section 270526 "Grounding and Bonding for Communications Systems."

## 2.4 SOFTWARE REQUIREMENTS

A. Telephone System Interface:

1. Permits use of wired and/or wireless telephones to execute nurse-call master station.
2. Two-way communication with patient and staff stations.
3. Two-way communication with the master nurse station.
4. "All Call," group call, and staff call paging.
5. Capable of being programmed to forward calls destined for a master nurse station to any connected telephone.
6. Telephones connected to the telephone interface shall have the same call tone ring patterns as those generated at the master nurse station.
7. Telephones having a display shall indicate the call type, priority code, and the calling station number of incoming calls.
8. Telephones shall be capable of initiating a service request for a particular patient station, logging calls on the master station's reminder list, and activating door lock mechanisms associated with a call station.
9. Capable of routine setup and configuration changes using the keypads on display telephone and/or the master station.

B. Display Telephones:

1. Digital telephones for use as mini-master nurse-call stations.
2. Digital display shall indicate the call type, priority code, and calling station number of incoming calls.
3. Ring patterns shall be identical to those generated at the master station.
4. Capable of two-way communication with patient and staff stations and the master station, and other telephones interfaced with the system.
5. Capable of placing or answering outside calls when interfaced with the facility telephone system.
6. Capable of "All Call," group call, and staff call paging and of initiating service requests, logging calls to the reminder list, and activating optional door controls.

C. Third-Party Pocket Pager Interface:

1. Equipped with a standalone pocket pager interface.
2. Connects with the facility paging system and transmit alphanumeric messages to the pocket pagers as preprogrammed in the system.

D. Statistical Software:

1. Includes a data statistical software package that stores, sorts, and analyzes activities occurring on the nurse-call system network.
2. Windows based and operated on a PC that is connected to the nurse-call system network.
3. Stores events on the PC's hard disk. Accumulation of these stored events shall make up the database that is used to generate reports and statistics.
4. Events stored by the software shall include date, day of week, time, ward, priority, and room number.
5. Capable of assigning a patient name to bed number.
6. Stored events shall include, but not be limited to, calls placed, call priority, calls cancelled at the nurse station, calls cancelled at the point of origin, regenerated calls, calls answered, calls sent to pager interface, staff presence registration, staff presence cancellation, service request, service cancellation, and system and network error messages.

E. Data Analysis Software:

1. Capable of analyzing the stored information and generating computed analysis.
2. Analysis of the database can be conducted by specifying one, many, or all of the following parameters of the database: date, day of week, time, wards, priority, and room number.
3. Analysis shall include, but not be limited to, total number of calls placed, average call response time (from call placed to call cancellation), total number of presence registrations, average presence time in a room, total number of service requests, average response time (from audio answer to call cancellation), and average ring time (from call placed to audio answer).

F. Statistical Software Package:

1. Capable of displaying multiple calls/events on a PC monitor or on a RS-485 data-bus-driven digital display panel.
2. Calls from patient or staff stations and associated devices shall be displayed by priority. Display shall be customizable as follows:
  - a. Choice of color by type of call.
  - b. Choice of display size (character size).
  - c. Choice of priority levels, type of events, points of origin.
  - d. Identification of facility.
  - e. Identification of ward.
  - f. Identification of patient with specific patient information.

2.5 CONDUCTORS AND CABLES

A. Audio Cables:

1. Conductors: Jacketed, twisted-pair and twisted-multipair, untinned solid copper. Sizes as recommended by system manufacturer, but no smaller than No. 22 AWG.
2. Insulation: Thermoplastic, not less than 1/32 inch thick.
3. Minimum Shielding Coverage on Conductors: 60 percent.

- 4. Plenum Cable: Listed and labeled for plenum installation.
- B. Data Cable and Hardware: Category 6 balanced twisted-pair cabling and hardware. Comply with requirements in Section 271100.
- C. Power Conductors and Cables: Copper, solid, No. 20 AWG. Comply with requirements in Section 260519 "Low-Voltage Electrical Power Conductors and Cables."
- D. Grounding Conductors and Cables: Copper, stranded, No. 16 AWG. Comply with requirements in Section 260526 "Low-Voltage Electrical Power Conductors and Cables."

### **PART 3 - EXECUTION**

#### **3.1 INSTALLATION**

- A. Wiring Method:
  - 1. Install cables in raceways and cable trays except within consoles, cabinets, desks, and counters and except in accessible ceiling spaces and in gypsum board partitions where unenclosed wiring method may be used.
    - a. Install plenum cable in environmental air spaces, including plenum ceilings.
    - b. Conceal raceway and cables except in unfinished spaces.
  - 2. Conduit and Boxes: Comply with requirements in Section 270528 "Pathways for Communications Systems."
- B. Install cables without damaging conductors, shield, or jacket.
- C. Do not bend cables, while handling or installing, to radii smaller than as recommended by manufacturer.
- D. Pull cables without exceeding cable manufacturer's recommended pulling tensions.
  - 1. Pull cables simultaneously if more than one is being installed in same raceway.
  - 2. Use pulling compound or lubricant if necessary. Use compounds that will not damage conductor or insulation.
  - 3. Use pulling means, including fish tape, cable, rope, and basket-weave wire or cable grips, that will not damage media or raceway.
- E. Install exposed raceways and cables parallel and perpendicular to surfaces or exposed structural members and follow surface contours. Secure and support cables by straps, staples, or similar fittings designed and installed so as not to damage cables. Secure cable at intervals not exceeding 30 inches and not more than 6 inches from cabinets, boxes, or fittings.
- F. Wiring within Enclosures: Bundle, lace, and train conductors to terminal points with no excess and without exceeding manufacturer's limitations on bending radii. Provide and use lacing bars and distribution spools.

- G. Separation of Wires: Separate speaker/microphone, line-level, speaker-level, and power-wiring runs. Run in separate raceways or, if exposed or in same enclosure, provide 12-inch minimum separation between conductors to speaker/microphones and adjacent parallel power and telephone wiring. Provide separation as recommended by equipment manufacturer for other conductors.
- H. Splices, Taps, and Terminations: Make splices, taps, and terminations on numbered terminal strips in junction, pull, and outlet boxes; terminal cabinets; and equipment enclosures. Install terminal cabinets where there are splices, taps, or terminations for eight or more conductors.
- I. Impedance and Level Matching: Carefully match input and output impedances and signal levels at signal interfaces. Provide matching networks if required.
- J. Identification of Conductors and Cables: Comply with requirements in Section 270553 "Identification for Communications Systems" for cable administration, cable schedule, and cable and wire identification.
- K. Equipment Identification:
  - 1. Comply with requirements in Section 270553 "Identification for Communications Systems" for equipment labels and signs and labeling installation requirements.
  - 2. Label stations, controls, and indications using approved consistent nomenclature.

### 3.2 GROUNDING

- A. Ground cable shields and equipment to eliminate shock hazard and to minimize ground loops, common-mode returns, noise pickup, cross talk, and other signal impairments.
- B. Signal Ground Terminal: Locate at main equipment cabinet. Isolate from power system and equipment grounding except at connection to main building ground bus.
- C. Grounding Provisions: Comply with requirements in Section 270526 "Grounding and Bonding for Communications Systems."

### 3.3 FIELD QUALITY CONTROL

- A. Manufacturer's Field Service: Engage a factory-authorized service representative to inspect, test, and adjust components, assemblies, and equipment installations, including connections.
- B. Perform tests and inspections.
  - 1. Manufacturer's Field Service: Engage a factory-authorized service representative to inspect components, assemblies, and equipment installations, including connections, and to assist in testing.
- C. Tests and Inspections:
  - 1. Schedule tests a minimum of seven days in advance.
  - 2. Report: Submit a written record of test results.

3. Operational Test: Perform an operational system test and demonstrate proper operations, adjustment, and sensitivity of each station. Perform tests that include originating station-to-station and "All Call" messages and pages at each nurse-call station. Verify proper routing, volume levels, and freedom from noise and distortion. Test each available message path from each station on the system. Meet the following criteria:
    - a. Speaker Output: 90 dB plus or minus 3 dB, 300 to 3000 Hz, reference level threshold of audibility 0 dB at 0.02 mPa of sound pressure.
    - b. Gain from patient's bedside station to nurse station, with distortion less than 65 dB (plus or minus 3 dB, 300 to 3000 Hz).
    - c. Signal-to-Noise Ratio: Hum and noise level at least 45 dB below full output.
  4. Test Procedure:
    - a. Frequency Response: Determine frequency response of two transmission paths by transmitting and recording audio tones.
    - b. Signal-to-Noise Ratio: Measure the ratio of signal to noise of the complete system at normal gain settings using the following procedure: Disconnect a speaker/microphone and replace it in the circuit with a signal generator using a 1000-Hz signal. Measure the ratio of signal to noise and repeat the test for four speaker microphones.
    - c. Distortion Test: Measure distortion at normal gain settings and rated power. Feed signals at frequencies of 300, 400, 1000, and 3000 Hz into each nurse-call equipment amplifier and measure the distortion in the amplifier output.
  - D. Retesting: Rectify deficiencies indicated by tests and completely retest work affected by such deficiencies at Contractor's expense. Verify, by the system test, that the total system meets these Specifications and complies with applicable standards. Report results in writing.
  - E. Inspection: Verify that units and controls are properly labeled, and interconnecting wires and terminals are identified.
  - F. Prepare test and inspection reports.
- 3.4 ADJUSTING
- A. Occupancy Adjustments: When requested within 12 months of date of Substantial Completion, provide on-site assistance in adjusting sound levels and controls to suit actual occupied conditions. Provide up to 3 visits to Project during other-than-normal operating hours for this purpose.
- 3.5 DEMONSTRATION
- A. Engage a factory-authorized service representative to train Owner's maintenance personnel and caregiver staff to adjust, operate, and maintain nurse-call equipment.

**END OF SECTION 275223**

**SECTION 28 05 00**

**COMMON WORK ELEMENTS FOR ELECTRONIC SAFETY AND SECURITY**

**PART 1 - GENERAL**

**1.1 STIPULATIONS**

- A. The specifications sections "General Conditions of the Construction Contract", "Special Conditions", and "Division 1 - General Requirements" form a part of this Section by this reference thereto and shall have the same force and effect as if printed herewith in full.
- B. Related Specification Sections:
  - 1. Division 07 – Through-penetration Firestop Systems
  - 2. Division 26 – Common Work Results for Electrical
  - 3. Division 26 – Low Voltage Electrical Power Conductors and Cables
  - 4. Division 26 – Grounding and Bonding for Electrical Systems
  - 5. Division 26 – Hangers and Supports for Electrical Systems
  - 6. Division 26 – Raceways and Boxes for Electrical Systems
  - 7. Division 26 – Identification for Electrical Systems
  - 8. Division 27 – General Requirements for Telecommunications
  - 9. Division 27 – Common Work Elements for Communications Systems
  - 10. Division 27 – Network Communications Systems
  - 11. Division 27 – Two-Way Communications System
  - 12. Division 27 – Audiovisual Systems
  - 13. Division 28 – Common Work Elements for Electronic Safety and Security
  - 14. Division 28 – Physical Electronic Safety and Security
  - 15. Division 28 – Video Surveillance System
- C. Reference Symbols:
  - 1. All device symbols are defined by the appropriate symbol schedule on the symbols and abbreviations sheet in the communications system drawing package. Not all device symbols as indicated may be required for the project.
    - a. Because of the scale of the drawings, symbols are shown on the drawings as close as possible to the mounting location. Contractor shall coordinate exact locations with architectural drawings and all affected trades prior to submittal of shop drawings.
- D. Abbreviations:
  - 1. ASIS: American Society Industrial Security (International)
  - 2. AP: Wireless Access Point
  - 3. A/V: Audio Visual Systems – For purposes of this specification section A/V systems shall include all Media Management, Video Broadcasting, Intercommunications (Paging/Public Address, Clock, Auxiliary Sound), Video Intercom, Emergency Communications, Mass Notification, Master Antenna (MATV) and Distance Learning Systems.
  - 4. AVI Audio Visual Systems Integrator: Shall be a qualified Contractor experienced in the installation and certification of A/V systems. The

AVI Contractor shall be responsible for the design, testing and certification of all audio/visual systems including but not limited to Intercommunications, TV Distribution, Audio/Visual, Master Antenna and Bi-Directional Antenna systems as well as all structured cabling systems supporting these technologies. The AVI shall be RCDD registered certified for the installation and commissioning of all structured cabling networks and communications systems.

5. BACnet: A communications protocol for building automation and control networks as outlined in ISO 16484-5 and ASHRAE/ANSI Standard 135.
6. BAS: Building Automation System
7. BICSI: Building Industry Consultant Services International- International organization whose primary objective is to enhance the reputation and skills of companies and individuals employed in the telecommunications and security industries by ensuring that current and developing standards are maintained.
8. CATV: Community Antenna Television System – Cable TV Network
9. CCD: Charge-coupled device.
10. CCTV: Closed Circuit Television Surveillance System.
11. CMOS: Complementary metal–oxide–semiconductor
12. CP: Consolidation Point - Local Interconnection Point between horizontal cables from the building IDF/MDF rooms and horizontal cables for the furniture drops.
13. CPU: Central Processing Unit
14. DP: Demarcation Point - The point of interface between the Communications Networks, MATV, any Auxiliary Systems, and the associated Service Providers or Public Utilities. Also known as Entrance Facility. Shall also serve as the primary termination point for all incoming OSP cabling as well as the primary main grounding bus-bar for all communications systems. Refer to project documents for exact location and termination requirements.
15. DVR: Digital Video Recorder.
16. DTS: Digital Termination Service: A microwave-based, line-of-sight communications provided directly to the end user.
17. DVT: Remote digital viewing terminal which shall serve as the video surveillance systems' operator HMI terminal remote from the primary rack mounted HMI.
18. EMI: Electromagnetic interference.
19. EMT: Electric Metallic Tubing.
20. ESS: Electronic Security Systems – Including but not limited to; intrusion detection, physical access control, CCTV video surveillance, electronic perimeter detection, duress alarm, programmable logic controllers (PLC), supervisory control and data acquisition (SCADA), integrated security management platforms and electronic screening systems.
21. ESSI: Electronic Security Systems Integrator– Shall be a qualified Contractor experienced in the design, programming, installation, testing and certification of all Intrusion Alarm, Access Control, CCTV Surveillance and Security Management Systems. The ESSI shall have a registered RCDD professional review and seal the designs, installations and certifications of all structured cabling networks related to the installation of any IP based electronic security system.
22. EVAC: UL Listed Emergency Voice Evacuation System. Not to be confused with the building; Public Address/Intercom, Intercommunications and/or Mass Notification systems.
23. FAS: Fire Alarm System
24. FASI: Fire Alarm System Integrator – Shall be a NICET Level III certified

- Contractor experienced in the installation, programming, testing and certification of Rescue Assistance, Protected Premises and Central Station Signaling Fire Alarm Systems as defined by NFPA 72.
25. GAP: Graphic Annunciator Panel – A custom fabricated fixed display panel providing operational control and visual display of all alarm and system functions related to the operation of the FAS and/or ESSM as described in related specification sections.
26. GFI: Ground fault interrupter.
27. GUI: Graphic User Interface – A specialized program employing graphical display maps of a facility and/or site which, also provides a manual user interface for all system functions and operations by utilizing control and annunciation ICON's from dedicated human machine interface terminals.
28. HMI: Human Machine Interface – A Computer-operated, video control terminal complying with FCC Part 15 CFR Title 47, Subparts A and B, and shall utilize multiple dynamic GUI based displays for annunciation and control LCD flat panel computer monitor or display screen as defined by related specification sections.
29. ICS: Intercommunications system – Shall include but not limited to all intercoms, public address, clock, program, and auxiliary sound or emergency communications systems as defined by related specification sections.
30. IDF: Intermediate Distribution Frame – The room/space that shall serve as the local termination point for all horizontal and backbone cabling. Also shall be known as Equipment Room (ER), Horizontal Cross-Connect (HC) or Floor Distribution (FD).
31. IDS: Intrusion Detection System.
32. I/O: Input/Out – Commonly associated with dry/contact relay based digital integration.
33. ITS: Information Transport Systems – For purposes of this specification section ITS shall include all data and telecommunications communications systems including but not limited to all Data, Telephone, Intercommunications (Paging/Public Address), TV Distribution Systems (MATV) and Audio Visual Systems (A/V) and IP based CCTV Surveillance Systems.
34. ITSI: Information Technology System Integrator – Shall be a qualified Contractor experienced in the installation and certification of all data, telecommunications and A/V systems. The ITSI shall be responsible for the design, testing and certification of Data, Telephone communications systems and all structured cabling systems supporting these technologies.
35. LAN: Local Area Network
36. LCD: Liquid-crystal display.
37. LED: Light Emitting Diode.
38. LV: Low Voltage: As defined in NFPA 70 for circuits and equipment operating at less than 50 V or for remote-control and signaling power-limited circuits.
39. MATV: Master Antenna System – Shall include all TV and media management distribution cabling, termination jacks, head-end components, control, equipment racks, amplifiers, projection equipment and video monitoring devices as defined by the project drawings and related specification sections.
40. MDF: The Main Distribution Frame – The room/space that shall serve as the primary termination point for all backbone cabling to each IDF locations and horizontal connection point for local communication drops. May also serve as a local IDF location as well as the cross-connection and interconnection of all entrance cables from the DP for all PSTN and WAN connections. Also shall be known as Main Cross Connect (MC), Telecommunications Room (TR) and/or Campus Distributor (CD)

- 41. M-JPEG: Motion – Joint Photographic Experts Group.
- 42. MPEG: Moving picture experts group.
- 43. NEC: National Electric Code
- 44. NEMA: National Electrical Manufacturers Association
- 45. NFPA: National Fire Protection Association
- 46. NTSC: National Television System Committee.
- 47. NRTL: Nationally Recognized Testing Laboratory.
- 48. NVR: Network Video Recorder
- 49. NVS: Network Video Server
- 50. OTDR: Optical Time Domain Reflectometer
- 51. OSP: Outside Plant – All cabling associated with building services supporting the incoming service connections to Service Providers, Public Utilities and Wide Area Networks.
- 52. PA: Public Address or Building Intercommunications System.
- 53. PBB: Telecommunications Primary Bonding Busbar
- 54. PACS: Physical Access Control System.
- 55. PIDS: Perimeter Intrusion Detection System
- 56. PIR: Passive Infrared
- 57. POTS: Plain Old Telephone Service – Analog Telephone Circuit used for the connection of FAX machines, BAS and FAS communications devices and shall be wired upstream of the facility's telephone switch.
- 58. PSP: Physical Security Professional as registered by the American Society of Industrial Security-International (ASIS)
- 59. PSTN: Public Switched Telephone Network – Connection to local telephone utility providing local telephony communications service.
- 60. RCDD: BICSI accredited Registered Communications Distribution Designer
- 61. RFI: Radio-frequency interference.
- 62. RIGID: Rigid conduit is galvanized steel tubing, with a tubing wall that is thick enough to allow it to be threaded.
- 63. RS-232: A TIA standard for asynchronous serial data communications protocol between terminal devices. This standard defines a 25-pin connector and certain signal characteristics for interfacing computer equipment.
- 64. RS-485: A TIA standard for multipoint communications protocol.
- 65. SBB: Telecommunications Secondary Bonding Busbar
- 66. SCADA: Supervisory Control and Data Acquisition – A system used in to monitor and control plant status of facilities scattered over wide geographic areas.
- 67. SMS: Security Management System – A system incorporating security alarms, door controls, emergency intercoms/paging, duress alarms and surveillance systems all integrated through a single operating platform, providing centralized command and control capability for the various systems via dedicated human machine interface terminals.
- 68. TCP/IP: The standard communications protocol that implement protocol stack on which the Internet and data communications networks operate
- 69. TP: Transition Point – A location in the horizontal cabling where flat under-carpet cable transitions to a horizontal cabling consolidation point (CP).
- 70. TVSS: Transient voltage surge suppressor
- 71. VLAN: Virtual LAN – A technique made possible by switching technologies that permits the logical grouping of any number of network devices into one or more sub- networks.
- 72. UPS: Uninterruptible Power Supply
- 73. UTP: Unshielded Twisted Pair
- 74. VMS: Video Management Software which shall software that incorporates multiple security subsystems (e.g., physical access control, intrusion detection, closed circuit television, intercom) into a single platform and

- graphical user interface.
- 75. VoIP: Voice Over IP telephone Network
  - 76. WAN: Wide Area Network
  - 77. WLAN: Wireless Local Area Network

E. Definitions:

1. Contract Documents: The documents consisting of the Form of Agreement between Owner and Contractor, Conditions of the Contract, (General, Supplementary, and other Conditions), Drawings, Specifications and all Addenda issued prior to the execution of the Contract.
2. Contract Drawings: The drawings that form a part of the Contract Documents that provides the graphical representation of the project requirements intended design and/or performance criteria to be delivered by the Contractor.
3. Reference Drawings: A drawing and/or set of drawings produced by a proprietary supplier, manufacturer, subContractor, or fabricator included in the Contract Documents for informational purposes, providing specific information related to the installation of related appurtenances, components, devices, hardware, products and/or systems. Reference Drawings shall also include any Contract Drawings from prior bid packages that may have pertinent information or require coordination of trades related to this contract.
4. Shop Drawings: A drawing and/or set of drawings produced by the Contractor, supplier, manufacturer, subContractor, or fabricator as a detailed representation of the proper installation of the related, appurtenance, component, device, hardware, product and/or system to be delivered in conformance to the requirements of the Contract Documents.

1.2 SUMMARY

- A. This Section contains the overall requirements associated with all Division 28 Specification Sections and includes the project design intent for all electronic security systems (ESS) as well as requirements for submittals, quality assurance, product handling, record documents, project conditions, installation, system performance, demonstrations, testing, training and certifications for all scopes of work related to these systems. Refer to related specification sections and contract drawings for additional information.
- B. The ESSI shall have overall responsibility for all designs, equipment and all technical support related to all Division 28 scopes of work and shall ensure full coordination of all work with relationship to the Division 26 Contractor as required to provide fully operational security systems as herein specified and in accordance with all requirements of the related specification sections and contract drawings.
- C. It shall be the responsibility of the Contractor to furnish and install all necessary cabling, conduits/raceways, cable terminations, controls, systems, equipment, materials, devices, components, electrical power, equipment racks/cabinets and software as well as all appurtenances, programming, commissioning and testing necessary to deliver complete and fully operational systems as indicated by all division 28 specification sections and related contract drawings.
  1. The installation, performance, features, functions, software and programming criteria as specified herein as well as all related Division 28 specification sections have been

designed to offer the maximum system efficiency, ease of operation, occupant safety and the protection of equipment as recommended by the Owner and Design Professional.

2. Any deviations from the specified criteria shall be documented, reviewed and agreed to in writing by Owner and Design Professional prior to submission of bids. Refer to Division 1, and all related Division 28 specification sections for any substitutions and/or project deviation requests.
    - 1) The required information shall include but not limited to: reason for deviation, all differences in performance, operation and function from the herein specified requirements, all benefits and added features to Owner as a result of the deviations and any additional incurred costs to Owner for maintenance and long term Ownership.
    - 2) Failure to provide the Owner and Design Professional with the required information shall result in any shop drawing submissions being returned for non-conformance with the contract requirements.
  3. The Contractor and all sub-Contractors for this work shall have read all of the General Conditions, Special Requirements, General Requirements, Division 1 and all related specification sections and in the execution of all work shall be bound by all of the conditions and requirements therein.
  4. Prior to the submission of the Bid any discrepancies or inconsistencies noted within these specifications and/or the project drawings shall be brought to the immediate attention of the Owner and Design Professional.
  5. All device symbols are defined by the appropriate symbol schedules as indicated by the symbol and abbreviation drawing sheets for each discipline. The Contractor shall coordinate exact locations with all architectural, mechanical, electrical, reflected ceiling, furniture drawings and door hardware specifications as well as all affected trades prior to submittal of shop drawings.
  6. All symbols are shown on the contract drawings as close as possible to their intended location. Contractor shall coordinate the installation of all equipment, devices, controls, components, cabling conduits/raceways and integration of other systems with all affected trades and specified system integrators. The Contractor shall document all coordination requirements at the time of shop drawing submission.
- D. Drawings for this work are diagrammatic and intended to convey the extent, general arrangement and locations of the work. Because of the scale of the drawings, certain basic items such as access panels, conduits, cabinet sizes, penetration sleeves, pull boxes, back-boxes and junction boxes may or may not be shown on the contract drawings. Include all items where required by code and related specification sections for proper installation of all work.
- E. Where ambiguity exists between the project specifications and the contract drawings, the superior in system performance regardless of cost shall prevail and shall be delivered by the Contractor at no additional expense to the project.
1. Project specifications and drawings may not deal individually with every part, control, device, component, or appurtenance which may be required to produce the equipment performance for the specified system and/or as required for compliance with all specified systems integration.
    - 1) Include such items and components, as required, for complete operational

systems as defined by the project documents, whether or not specifically indicated. The Contractor shall be responsible for providing conduits/raceways, cable terminations, controls, systems, equipment, materials, devices, components, electrical power, equipment racks/cabinets, software, programming, commissioning, testing and all appurtenances as well as the integration of any ancillary systems or Owner provided equipment/components/systems.

- 2) Coordinate with other applicable trades in submittal of shop drawings and the installation of all systems. All shop drawings shall detail space conditions in order to accommodate other concerned trades, all equipment locations are subject to final review by the Owner and Design Professional.

### 1.3 REFERENCES

- A. References to industry and trade association standards as well as all building codes are minimum installation requirements. The codes, standards and agencies listed below shall form a part of this specification section and all work shall comply with the latest adopted standards.
- B. The publications listed below (including amendments, addenda, revisions, supplement, and errata) form a part of this and all related division 28 specification sections to the extent referenced. The publications are referenced in the text by the basic designation only.
- C. Where the contract drawings and specifications mandate a greater requirement or performance than those specified by any of the below referenced codes and standards, the Contract Documents shall then be the governing requirements for this project. The minimum codes and standards to be applied for this project shall be the following:

1. American National Standards Institute (ANSI)/ International Code Council (ICC):
  - a. A117.1 - Standard on Accessible and Usable Buildings and Facilities
2. American National Standards Institute (ANSI)/ Security Industry Association (SIA):
  - a. AC-03 - Access Control: Access Control Guideline Dye Sublimation Printing Practices for PVC Access Control Cards
  - b. CP-01-00 - Control Panel Standard-Features for False Alarm Reduction
  - c. PIR-01-00 - Passive Infrared Motion Detector Standard - Features for Enhancing False Alarm Immunity
  - d. TVAC-01 - CCTV to Access Control Standard - Message Set for System Integration
3. American National Standards Institute (ANSI):
  - a. 330-09 - Electrical Performance Standards for CCTV Cameras
  - b. 375A-76 - Electrical Performance Standards for CCTV Monitors
4. American National Standards Institute (ANSI):
  - a. ANSI S3.2-99 - Method for measuring the Intelligibility of Speech over Communications Systems

5. American Society for Testing and Materials (ASTM)
  - a. B1-07 - Standard Specification for Hard-Drawn Copper Wire
  - b. B3-07 - Standard Specification for Soft or Annealed Copper Wire
  - c. B8-04 - Standard Specification for Concentric-Lay-Stranded Copper Conductors, Hard, Medium-Hard, or Soft
  - d. C1238-97 (R03) - Standard Guide for Installation of Walk-Through Metal Detectors
  - e. D2301-04 - Standard Specification for Vinyl Chloride Plastic Pressure Sensitive Electrical Insulating Tape
6. Department of Justice: American Disability Act (ADA)
  - a. 28 CFR Part 36-2010 - ADA Standards for Accessible Design
7. Federal Communications Commission (FCC):
  - a. (47 CFR 15) Part 15 - Limitations on the Use of Wireless Equipment/Systems
8. Federal Information Processing Standards (FIPS):
  - a. FIPS-201-1 - Personal Identity Verification (PIV) of Federal Employees and Contractors
9. Federal Specifications (Fed. Spec.):
  - a. A-A-59544-08 - Cable and Wire, Electrical (Power, Fixed Installation)
10. Owner Accountability Office (GAO):
  - a. GAO-03-8-02 - Security Responsibilities for Federally Owned and Leased Facilities
11. Homeland Security Presidential Directive (HSPD):
  - a. HSPD-12 - Policy for a Common Identification Standard for Federal Employees and Contractors
12. Institute of Electrical and Electronics Engineers (IEEE):
  - a. 81-1983 - IEEE Guide for Measuring Earth Resistivity, Ground Impedance, and Earth Surface Potentials of a Ground System
  - b. 802.3af-08 - Power over Ethernet Standard
  - c. 802.3at-09 - Power over Ethernet (PoE) Plus Standard
  - d. C2-07 - National Electrical Safety Code
  - e. C62.41-02 - IEEE Recommended Practice on Surge Voltages in Low-Voltage AC Power Circuits
  - f. C95.1-05 - Standards for Safety Levels with Respect to Human Exposure in Radio Frequency Electromagnetic Fields
13. International Building Code (IBC)
14. International Organization for Standardization (ISO):
  - a. 7810 – Identification cards – Physical characteristics
  - b. 7811 – Physical Characteristics for Magnetic Stripe Cards

- c. 7816-1 – Identification cards - Integrated circuit(s) cards with contacts - Part 1: Physical characteristics
  - d. 7816-2 – Identification cards - Integrated circuit cards - Part 2: Cards with contacts - Dimensions and location of the contacts
  - e. 7816-3 – Identification cards - Integrated circuit cards - Part 3: Cards with contacts - Electrical interface and transmission protocols
  - f. 7816-4 – Identification cards - Integrated circuit cards - Part 11: Personal verification through biometric methods
  - g. 7816-10 – Identification cards - Integrated circuit cards - Part 4: Organization, security and commands for interchange
  - h. 14443 – Identification cards - Contactless integrated circuit cards; Contactless Proximity Cards Operating at 13.56 MHz in up to 5 inches distance
  - i. 15693 – Identification cards -- Contactless integrated circuit cards - Vicinity cards; Contactless Vicinity Cards Operating at 13.56 MHz in up to 50 inches distance
  - j. 19794 – Information technology - Biometric data interchange formats
15. The Joint Commission (TJC) formally - Joint Commission on Accreditation of Healthcare Organizations (JCAHO)
16. National Electrical Contractors Association
- a. 303-2005 – Installing Closed Circuit Television (CCTV) Systems
17. National Electrical Manufacturers Association (NEMA):
- a. 250-08 – Enclosures for Electrical Equipment (1000 Volts Maximum)
  - b. TC-3-04 – PVC Fittings for Use with Rigid PVC Conduit and Tubing
  - c. FB1-07 – Fittings, Cast Metal Boxes and Conduit Bodies for Conduit, Electrical Metallic Tubing and Cable
18. National Fire Protection Association (NFPA):
- a. 70-2011 – National Electrical Code (NEC)
  - b. 72-2010 – National Fire Alarm and Signaling Code
  - c. 90A 2009 – Installation of Air Conditioning and Ventilating Systems
  - d. 101-2009 – Life Safety Code
  - e. 731-2008 – Standards for the Installation of Electric Premises Security Systems
  - f. 99-2005 – Health Care Facilities

#### 1.4 SUBMITTALS

- A. In addition, to all submittal requirements as stipulated by Division 01 specifications sections, the Contractor shall provide all shop drawing submittals in accordance with the following:
- 1. The Owner and Design Professional approval shall be obtained for all equipment and material before delivery to the job site. Delivery, storage, or installation of equipment or material which has not had prior approval will not be permitted at the job site.
  - 2. All submittals shall include adequate descriptive literature, catalog cuts, shop drawings, and other data necessary for Owner to ascertain that the proposed equipment and materials comply with specification requirements. Catalog cuts submitted for approval shall be

- legible and clearly identify equipment being submitted.
3. Submittals shall be provided as a complete submission, no partial submissions will be accepted. Failure to provide a complete submission shall result in all submittals being returned for resubmission.
4. No substituted equipment shall be reviewed without prior approval in accordance with the requirements of "substitutions" under Division 1 specification section.
5. Mark the submittals, "SUBMITTED UNDER SECTION \_\_\_\_\_".
  - a. Submittals shall be marked to show specification reference including the section and paragraph numbers.
6. The Contractor shall schedule submittals in order to maintain the project schedule. For coordination requirements refer to Division 01 Specification Sections, which outline basic submittal requirements and coordination. All Division 01 Specification Sections requirements shall be used in conjunction with this specification section.
7. Prior to any submission the Contractor shall be responsible for performing the following quality control items to ensure compliance with all project requirements:
  - a. Review all Shop Drawings and Product Data
  - b. Review all field measurement criteria.
  - c. Review all field construction criteria and methodologies.
  - d. Review all catalog numbers and similar data.
  - e. Review all coordination requirements of affected trades.
  - f. Review conformance to all appropriate specification sections.
8. All drawings shall be prepared using computer aided design software. The Contractor shall not reproduce the Contract Documents or copy standard information as the basis of the technical data, hand drawn mark-ups of the original project drawings shall not be acceptable. Failure to provide a complete set of "Contractor prepared" installation drawings at the time of submittal shall result in all submittals being returned for resubmission.
9. The ESSI shall have a registered RCDD professional review and seal all system designs, installations and testing certification for all electronic security systems and associated structured cabling. Failure to provide RCDD sealed shop drawings shall result in all shop drawings being returned for resubmission without any reviews taking place.
10. The Design Professional's review of shop drawings and/or samples does not relieve the Contractor from compliance with all requirements of the project documents. No deviations from the project requirements shall be accepted unless the Contractor has informed Owner and Design Professional in writing of any such deviations prior to the submission of shop drawings, has noted all deviations on the shop drawing submission, and Owner and Design Professional has given written approval for the specific deviations to the project documents, otherwise all project requirements shall stand. Owner and Design Professional's review does not relieve the Contractor from any responsibility for delivering all criteria as stipulated by the contract documents because of errors, lack of clarity or omissions on the part of the Contractor in the review of shop drawings and/or samples by the Design Professional.
11. Submit all system testing and startup procedures to be employed. Include all estimated times for performance of all tests, all test equipment and manpower necessary for testing.
12. Submit all integrator qualifications, certifications and licenses in accordance with the requirements as specified elsewhere in this specification section.
13. Submit project schedule outlining the time frames for all equipment with long lead times for equipment deliveries; include all system commissioning, testing and training time expectations. Project schedule shall be submitted as CPM schedule and shall utilize a

software based project management program.

**B. Shop Drawings:**

1. All shop drawings shall include sufficient information, clearly presented, to determine full compliance with all project drawings and specifications. Include the following information for review, failure to provide all information listed below shall result in all shop drawing submittals being returned for resubmission:
  - a. All Building Floor and Site Plans
  - b. All equipment with manufacturer's name(s), model numbers,
  - c. All equipment /device electrical ratings and power requirements
  - d. All equipment /device performance ratings.
  - e. All standby battery and wiring voltage drop calculations
  - f. All surge and/or transient protection devices and device locations
  - g. All equipment rack, panels and cabinet layouts, rack/cabinet sizes.
  - h. All equipment and device-mounting elevations.
  - i. All device wiring details.
  - j. Complete point-to-point-wiring diagrams for all systems.  
Include all equipment and wiring termination schedules and programming matrixes.
2. Provide a complete set of "Contractor prepared" installation drawings. All drawings at the minimum shall consist of floor plans indicating all device locations, device identifications, control panels, auxiliary control panels, power supplies, annunciation panels, conduit and cabling requirements as well as all 120 volt electrical circuit locations and designations.
  - a. Drawings shall include at the minimum the following:
    - 1) Detailed equipment layouts for all equipment rooms. Coordinate all room layouts with affected trades.
    - 2) Floor plan drawings showing locations of all control panels, sub-panels, ancillary controls, equipment cabinets and/or racks, annunciator panels, HMI terminals, auxiliary power supplies, devices and sensors, electrical power and grounding terminations as well as all device\sensor identifications
    - 3) Conduit routing of all conduits 2 inches in diameter or greater.
    - 4) System riser diagrams and single line drawings representing interconnections of all system control panels, sub- panels, ancillary controls, equipment cabinets and/or racks, annunciator panels, HMI terminals, auxiliary power supplies, devices, sensors and components, include all cable types and sizes, electrical power connections and circuits, grounding connections, surge and/or transient protection devices and all field device\sensor identifications.
    - 5) Block diagrams and Logic flow charts representing all systems architecture and interconnection of the security management systems (SMS) and fire management systems (FMS) all related integrated subsystems. Include detailed information on all system component integrations, data transmission and media conversions as well as logical functional data and performance criteria.
    - 6) Equipment wattage for all equipment room locations and estimated BTU production.
    - 7) Detailed equipment layouts for all equipment consoles. Indicate all equipment

- locations, power connections and installation details. All equipment mounting hardware/brackets and installation details, Identify type size, load capacities of all mounting hardware/brackets; include all mounting and installation details, all space requirements, any special architectural modifications required.
- 8) Outline drawings of all equipment cabinets/racks showing the relative position of all major components, all-wiring and grounding terminations. Include all panel, cabinet and/or rack dimensions.
- 9) Door Schedules for each door equipped with electronic security components. At a minimum, the door schedules shall be coordinated with Division 08 work and include the following information:
- a) Door Number (Extracted from Architectural Drawings)
  - b) Door location on security floor plan drawing
  - c) Installation Details
  - d) Door Description (Extracted from alarm programming matrixes)
  - e) Data Gathering Panel Input Number
  - f) Door Position or Monitoring Device Type & Model Number
  - g) Lock Type, Model Number & Power Input/Draw (standby/active)
  - h) Card Reader Type & Model Number
  - i) Shunting Device Type & Model Number
  - j) Sounder Type & Model Number
  - k) Delayed Egress Type & Model Number
  - l) Intercom (video or standard)
  - m) Camera ID# associated with camera call-up (Extracted from alarm programming matrixes)
  - n) Type of Electric Transfer Hinge
  - o) Electric Pass-through device
  - p) Remarks Column for Camera
- 10) Camera Schedules for all interior and exterior cameras.  
Note: camera schedule shall be coordinated with the Owner and Design Professional for determination of camera numbers and naming conventions. At a minimum, the camera schedules shall include the following information:
- a) Camera Number
  - b) Camera Naming Convention
  - c) Description of Camera Coverage
  - d) Camera Location description
  - e) Camera location on Floor Plan drawings (include sheet and grid number)
  - f) Camera Type & Model Number
  - g) Mounting Type & Model Number
  - h) Installation Details
  - i) Cable Sizes, Types, Conductors, and Color
  - j) Power Input & Current Draw
  - k) Power Supply Location and electrical circuit number
  - l) Automatic Camera Call input (Extracted from alarm programming matrixes)
  - m) Remarks Column for Camera

3. All shop drawing submissions shall have a registered RCDD professional review and seal all

shop drawings confirming that the proposed cabling infrastructures and terminations are in conformance with all stipulated standards and requirements as herein specified or in related specification sections.

4. Failure to provide all required documentation in accordance will ALL related specification requirements at the time of shop drawing submission shall result in all submittals to be returned for non- compliance to the contract requirements.

**C. Equipment Submittals and Data Sheets:**

1. Sufficient information, clearly presented, shall be included to determine compliance with drawings and specifications.
  - a. Include all equipment data sheets pertinent to equipment provided. All data sheets shall be highlighted indicating specific equipment supplied. Failure to provide the proper annotation of all equipment shall result in submittals being returned for resubmission.
2. Submit complete technical data necessary to evaluate the material and equipment. Include a complete technical specification for the submitted equipment, noting differences and adherence to this Section. Failure to provide the required data will result in all submittals being returned for resubmission.
3. Submit performance data, equipment ratings, cable requirements, control sequences, GUI based control panels, programming matrixes, logic diagrams and all other descriptive data necessary to describe the installation and operations of the system being provided. Failure to provide the required data will result in all submittals being returned for resubmission.
4. Provide a complete termination schedule of all system devices, sensors, components, equipment and controls, identify all locations as indicated on the installation drawings, include all unique identification numbers which correspond with shop drawing floor plans.
  - a. Include point to point wiring terminations and programming matrixes for all readers and devices
5. Provide a clear and concise sequence of operation that gives, in detail, all information required to properly operate all equipment and systems. Include detailed programming matrixes, indicating at the minimum all manual and automatic functions for all system, components and devices comprising the system being provided.
6. Provide copies of all preliminary graphic screens for all HMI configurations for this project. Graphic maps shall indicate all site plans, floor plan maps, utility screens, camera/monitor interface screens all door control functions, intercom activation's, alarm indications, door interlock functions and ancillary controls.
7. Provide a listing of all recommended time zone and alarm shunting functions.
8. Provide a preliminary list of all on screen emergency response instructions and help menus.
9. Provide system parts list which shall include those replacement parts recommended by the equipment manufacturer, quantity of parts, current price and availability of each part.
10. Failure to provide all required documentation in accordance will ALL related specification requirements at the time of shop drawing submission shall result in all submittals to be returned for non- compliance to the contract requirements.

**D. Maintenance and Operation Manuals: Submit in accordance with all requirements of**

Division 01 specification sections and as herein specified.

1. Maintenance and Operation Manuals shall be submitted for all systems and equipment specified in the technical sections. Furnish the number of copies as specified by Division 1, all manuals shall be bound in hardback binders, (manufacturer's standard binders) or an approved equivalent prior to the commissioning, testing and final acceptance of each system.
  - a. The Contractor shall also furnish one complete set of manuals as specified herein at the time of shop drawing submission for Design Professional s' use in the review of all submittals.
2. Inscribe the following identification on the cover: "Maintenance and Operational Manual" include the name and location of the system, equipment, building, name of Contractor, and contract number. Include in the manual the names, addresses, and telephone numbers of each subContractor installing the system or equipment and the local representatives for the system or equipment.
  - a. The Maintenance and Operation Manuals at the minimum shall include:
    - 1) Copy of approved shop drawing and equipment submittals
    - 2) Internal and interconnecting wiring and control diagrams
    - 3) with data to explain detailed operation and control of all equipment, components, devices and servers.
    - 4) A complete control sequence describing start-up, operation, and shutdown of all equipment, components, devices and servers.
    - 5) Description of the function of each principal item of equipment.
    - 6) Installation and maintenance instructions
      - a) Safety precautions
      - b) Diagrams and illustrations.
      - c) Testing methods.
      - d) Performance data.
      - e) Pictorial "exploded" parts list with part numbers. Emphasis shall be placed on the use of special tools and instruments. The list shall indicate sources of supply, recommended spare parts, and name of servicing organization.
      - f) Appendix; list qualified permanent servicing organizations for support of the equipment, including addresses and certified qualifications.
  - b. Failure to provide all required documentation in accordance with ALL related specification requirements at the time of shop drawing submission shall result in all submittals to be returned for non-compliance to the contract requirements.

#### 1.5 QUALITY ASSURANCE

- A. In addition to all general provisions of the Contract, including but not limited to all; General and Supplementary Conditions, Division 01 Specification Sections include the following project requirements:
  1. Integrator Qualifications: The projects' Electronic Security System Integrator (ESSI) shall

be an accredited and authorized distributor of the appropriate equipment manufacturer and shall be fully certified in the installation, testing and programming of all equipment being provided. The ESSI shall be a licensed security Contractor with a minimum of five (5) years' experience installing and servicing systems of similar scope and complexity.

- a. The ESS integrator shall be capable of providing documented successful work experience of at least three (3) facilities of equivalent size and technical requirements utilizing the proposed equipment being provided. The system integrator shall have on staff a minimum of one full time individual that holds a current RCDD registration.
  - 1) All electronic security systems and related work shall be certified in writing to the Owner and Design Professional by a RCDD professional asserting that all electronic security system shop drawings and all associated structured cabling is in conformance with all appropriate NEC requirements, EIA/TIA standards; NFPA 731 recommended practices, BICSI recognized installation practices and all related specification sections.
2. Cable Installer Qualifications: The cable installation Contractor shall demonstrate not less than three (3) years' experience in the installation of structured cabling systems and shall have on staff a minimum of one full time member that holds a current BICSI level II installer credential.
  - a. NOTE: The installation of all cabling shall be under the direct supervision of a current BICSI level II installer who shall be knowledgeable in the following technical applications:
    - 1) The Routing and installation of shielded, unshielded, twisted pair, coaxial and fiber optic cables.
    - 2) Generally accepted industry standards, as well as manufacturers written installation instructions, will be used for in-process quality control and final acceptance of the work installation.
  - b. Provide registration number and expiration date of BICSI level II installer assigned to the project.
3. The Owner and Design Professional reserve the right to require the Contractor to submit a list of installations where the products have been in operation before approval of shop drawings.
  - a. Experience shall be defined as the completion of the specific system being provided, with that system being successfully operated by Owner for its intended purpose for at least three (3) years.
  - b. In addition to the above "Experience" shall also be defined as the completion of modifications and renovations to any associated system being provided in any existing occupied facility of this size and magnitude.
  - c. For each facility submit the following:
    - 1) Name and location of facility.
    - 2) Date of Occupancy or beneficial use by Owner.
    - 3) Owner's representative to contact and telephone number.
    - 4) Construction Manager or General Contractor.
    - 5) Project Architect or Engineer.

- 6) Provide detailed information on the installed locations with operational equipment.
4. Service Qualifications: The ESSI shall be a permanent service organization maintained and/or trained by the product manufacturer on the products being provided for this project.
  - a. The integrator shall be properly licensed by the governing municipality (where required) certified to provide the services and work of the specific system being provided.
  - b. In addition, all integrators shall be capable of providing full service for the entire warranty period within an 8-hour response time upon notification of a service emergency.
  - c. Provide registration number and expiration date of RCDD professional.
5. Manufacturers Qualifications: The manufacturer shall regularly and presently produce, as one of the manufacturer's principal products, the equipment and materials specified for this project, and shall have manufactured the items for at least three years.
  - a. Product Qualification: The Manufacturer's product shall have been in satisfactory operation, on three installations of similar size and type as this project, for approximately three years.
  - b. The equipment manufacturer shall submit the appropriate documentation certifying that the project integrator is a qualified service provider and certified in the installation and programming of all manufacturers' products being provided for this project.

#### 1.6 RECORD DOCUMENTS

- A. In addition to all general provisions of the Contract, including but not limited to all; General and Supplementary Conditions, Division 01 Specification Sections include the following project requirements.
  1. Provide complete set of finalized copies of record documents prior to final acceptance of the project by Owner and Design Professional in accordance with all requirements of Division 01 specification sections. At the minimum the record documents shall contain all information, data and drawings as described in Chapter 1.4 "Submittals" of this specification section.
    - a. As-built documents shall be submitted in both paper and electronic media formats in the quantities as specified by Division 1 specification requirements.
      - 1) All electronic data sheets, control sequences, programming matrixes and other descriptive data shall be provided in PDF format.
      - 2) Copies of all current system programming and associated software shall be provided on downloadable media formatted for the use in restoration all system operations and functionality in the event of a catastrophic failure.

#### 1.7 SOFTWARE AGREEMENT

- A. Included as part of the scope of work for this project Owner shall retain Ownership and access rights of ALL system programs and software associated with all systems installed and/or modified as part of this project.

1. The Contractor shall provide to Owner complete copies of all current software programming and software licenses related to the operation of each system prior to final acceptance of the related Contract scopes of work.
    - a. All programming shall include but not be limited to all device identifications, device descriptions, Programming Logic Matrixes, all program access level passwords as well as all function and sub-function routines.
  2. Programming and software copies shall be provided to Owner on CD or DVD digital formatted media. In addition, the Contractor shall provide a complete hard copy printout of all system programming and shall be included as part of closeout documentation for review by Owner and Design Professional.
- B. Software and firmware upgrade provisions shall be included as part of this specification requirement and shall include the automatic upgrades as required to maintain all software and firmware to the manufacturers most current revision on all system components installed and or modified as part of this project for duration of the warranty period. This upgrade policy shall require the Contractor to install, test and certify all software and firmware upgrades that become available from manufacturer for a period of one year from date of final acceptance to the expiration of the warranty.
1. Upgrading of software shall include all revised/new software, labor, testing certification as well as all licenses, software and all programming copies as described in Chapter 1.6 of this section associated with the installation of all revised software.
  2. These updates shall be accomplished in a timely manner, fully coordinated with the system operators, and incorporated into the operations\maintenance and software documentation manuals.
    - a. One (1) scheduled final update shall be provided near the end of the warranty period, at which time the Contractor shall install and validate the latest released version of the Manufacturer's software and firmware for all systems installed and\or modified for this project.
    - b. All software changes shall be recorded in a log maintained in the unit control. An electronic copy of the most current software update shall be maintained within the log.
      - 1) At a minimum, the Contractor shall provide a description of the modification, when the modification occurred, and name and contact information of the individual performing the modification. The log shall be maintained in a white 3 ring binder and the cover marked "Software Change Log".
  3. Provide not less than thirty days' notice to the Owner and Design Professional to allow scheduling and access to system and to allow Owner to upgrade computer equipment if necessary.

#### 1.8 EXTRA MATERIAL

- A. In addition to all general provisions of the Contract, including but not limited to all; General and Supplementary Conditions, Division 01 Specification Sections refer to related specification sections "Extra Material" for specific requirements.

- B. All Extra materials shall be provided at the time of final acceptance of the project and a signed packing list shall be obtained at the time of delivery. At no time is the Contractor to use the extra materials provided for this project to replace malfunctioning or damaged equipment and or components.
- C. Provide 5% of all material as “ Extra Material.”

## **PART 2 – PRODUCTS**

### **2.1 MANUFACTURED PRODUCTS**

- A. Materials and equipment furnished shall be of current production by manufacturers regularly engaged in the manufacture of such items, that meet and/or exceed the specified performance and features of the equipment and/or systems and for which replacement parts shall be readily available to the system integrator and/or using agency.
  - 1. When more than one unit, device or component of the same class of equipment is required, such units, devices or components shall be the product of a single manufacturer.
  - 2. Acceptable manufacturers for each system shall be as specified and shall be provided in full compliance with the requirements of this and all related specification sections and contract drawings.
    - a. Manufacturers listed as acceptable shall not negate the Contractors’ responsibility for providing all equipment, devices, components and/or systems, in accordance with all functions and performance requirements of the Contract Documents.
    - b. Where manufacturer and/or manufacturer model numbers reference specific system components in the related specification sections, it is to establish the performance requirements and quality of the systems and components only.
      - 1) It is in no way an inference that the referenced model numbers are the manufacturer’s current product and are the only acceptable components for this project unless specifically referenced as “no substitutions”.
    - c. The Contractor shall provide the manufacturers’ most current product that shall meet and/or exceed the specified performance and features of the equipment and/or systems.
    - d. Equivalent UL- listed equipment may be substituted for the approved manufacturers unless stipulated by other specification sections as “No Substitutions”. All substitutions shall be submitted for approval by Owner and Design Professional in accordance with all requirements of Division 01 specification sections and Chapter 1.4 “Submittals” of this specification section.
      - 1) Where systems and/or components are referenced as “no substitutions” the specific system and/or components shall be provided.
      - 2) All substitutions shall comply with all requirements as specified above and all system performance standards shall be maintained.
      - 3) The Contractor shall stipulate the following information impacted by such a substitution.

- a) Any and all extensions in time impacted by the substitution.
    - b) Any changes to the architectural or structural elements to the project
    - c) Differences in operation and/or performance from intended system criteria.
  - 4) Failure to provide the required substitution information shall result in “without consideration” the immediate rejection of the substituted equipment and/or systems.
- B. Equipment Assemblies and Components:
- 1. Components of an assembled unit need not be products of the same manufacturer.
    - a. Manufacturers of equipment assemblies, which include components made by others, shall assume complete responsibility for the final assembled unit.
    - b. Components shall be compatible with each other and with the total assembly for the intended service.
    - c. Constituent parts which are similar shall be the product of a single manufacturer.
    - d. Factory wiring shall be identified on the equipment being furnished and on all wiring diagrams.
- C. Where Factory or Off-Premises Testing of any equipment, product or assembly is recommended by the product manufacturer or where specified as part of this section and/or any related specification section:
- 1. Owner and/or Owner representatives shall have the option of witnessing all factory tests. The Contractor shall notify the Design Professional at a minimum of thirty (30) working days prior to the performance of any factory or off-premises tests.
    - a. Where the factory or assembly point for all off-premises testing is not within two (2) hours driving time from the project location, the ESSI shall include as part of this project all per diem costs (travel, meals and lodging) for a minimum of two representatives of the using agency and the project Design Professional to witness all testing.
  - 2. Provide four (4) copies of certified test reports containing all preliminary test data and testing procedures shall be furnished to the Owner and Design Professional prior to any final testing and not more than ninety (90) days after completion of any tests.
  - 3. When equipment, product or assembly fails to meet any factory or off-premises tests, retesting of equipment, product or assembly shall be mandated, the Contractor shall be liable for all additional expenses, including all expenses incurred by the Owner and Design Professional for witnessing the retesting of any equipment, product or assembly.

## **PART 3 – EXECUTION**

### **3.1 EQUIPMENT PROTECTION**

- A. Protect all materials, equipment, devices or components permanently installed and/or stored on the job site. Protect all materials, equipment, cabling, devices or components during construction

and after installation, provide appropriate protection of all materials, equipment, components and/or devices until time of substantial completion. All materials, equipment, components and/or devices shall be protected during shipment and storage against any physical damage, dirt, moisture, cold, snow or rain:

1. During installation, enclosures, equipment, controls, controllers, circuit protective devices, and other like items, shall be protected against entry of any foreign matter; and shall be vacuum cleaned both inside and outside before testing and operating and repainting if required.
  2. Any materials, equipment, components and/or devices, stored on site which have been deemed by the Design Professional to exhibit any indications of damage or exposure dust or moisture shall not be installed and shall returned to the source of supply for immediate replacement.
    - a. The use of spare parts or the return of defective equipment for repair to mitigate the damage of defective materials, equipment, components and/or devices shall not be acceptable. All materials, equipment, components and/or devices shall be new and unused until final acceptance by the Design Professional.
  3. Provide and apply protective material immediately upon receiving the products and maintain throughout the construction process.
    - a. Painted surfaces shall be protected with factory installed removable heavy kraft paper, sheet vinyl or equal.
    - b. Any damaged paint on equipment and materials shall be refinished with the same quality of paint and workmanship as used by the manufacturer so repaired areas is not obvious or detectable.
  4. Failure to properly protect all materials, equipment, components and/or devices prior to final acceptance shall constitute sufficient cause for rejection of materials, equipment, components and/or devices should any defects, damage or degradation in performance is observed.
- B. Immediately replace all malfunctioning materials, equipment, components and/or devices with new unused products up until the time the Design Professional issues final acceptance of the system. The returning of any malfunctioning equipment, devices and/or components to the manufacturer for repair and then reinstallation at the project site shall not be acceptable.
1. All replacement materials, equipment, components and/or devices shall be factory new and not scavenged from the Project's spare parts inventory or factory recycled products unless expressly identified by Contractor prior to replacement and approved beforehand by the Design Professional.

### **3.2 WORK PERFORMANCE**

- A. Installation, final termination, testing, start-up and commissioning of all systems, system components and cabling infrastructures shall be under the direct supervision of the appropriate system integrator. The integrator shall be an accredited and authorized distributor of the appropriate equipment manufacturer and shall be fully certified in the installation, testing, commissioning and programming of all equipment, devices, components and/or systems being provided as part of this project.
- B. Job site safety and worker safety is the responsibility of the Contractor. Ensure that safe access

and egress from all work areas is maintained during movement and installation of materials. Clean up all debris generated by installation activities. Keep all security electronic equipment rooms free of debris at all times.

- C. Pre-installation Conferences: Include provisions to attend all pre- installation conferences at Project site in compliance with all requirements in Division 01 specification section and as herein specified. Review methods and procedures related to installation and operations of all safety and security systems, including, but not limited to, the following:
  - 1. Inspect and discuss electrical and control system roughing-in related to all safety and security systems as well as other preparatory work required to be performed by other trades.
  - 2. Review sequence of operations for each type of system, controls and/or integration to any systems and/or equipment provided by other trades
  - 3. Review and finalize construction schedule and verify availability of materials, installation personnel, equipment, and any preparatory work by other trades needed to make progress and avoid delays.
  - 4. Review required start-up, testing, commissioning and certifying procedures to be employed for each system and any impacts to other trades.
- D. For work on existing facilities, arrange, phase and perform work to assure the operation of all security systems for other buildings and contiguous spaces at all times. Refer to Division 1 specification section for additional information.
- E. All new work shall be installed and connected to existing work neatly and carefully. Disturbed or damaged work shall be replaced or repaired to its prior conditions, as required by Division 1 specification sections.
- F. Coordinate the installation of all cabling, conduits/raceways and cable trays and equipment with applicable trades to ensure proper operation and function of all integrated systems in accordance with all related specification sections. Refer to Division 1 specification section for additional project coordination requirements.
  - 1. Coordinate with all trades at the time of shop drawing submission detailing all space and/or room conditions. The Contractor shall coordinate with the appropriate trade all conditions impacting the installation of any system including but not limited to all equipment locations, ceilings, lighting fixtures, fire protection piping and ductwork layouts to the satisfaction of all concerned trades, subject to final review by the Design Professional.
    - a. Coordinate exact location of all desktop/counter/wall mounted equipment with the Owner and Design Professional and affected trades prior to the installation of any equipment and/or cabling.
    - b. Coordinate exact location(s) of all ceiling mounted cable, conduits, equipment and/or devices with all architectural plans, reflected ceiling plans and affected trades prior to installation.
    - c. Equipment installations requiring coordination with other trades the Contractor shall provide all templates, back-boxes and equipment anchor bolts for mounting or flush mounting preparation, (e.g. pedestals or other devices requiring mounting on walls, concrete pads or other materials). Coordinate delivery of templates and equipment anchor bolts to preclude any delay in the construction schedule or the work of the affected trade.

- d. If installation of equipment, devices, cabling, raceways, cable trays and/or conduit is performed prior to coordination with other trades, which interferes with work of other trades or operation and maintenance of the facility, make necessary changes to correct the condition at no additional cost to Owner.
  - e. Prior to the final programming of any systems review with Owner and Design Professional all system features, functions, system operations, network mapping, system integrated responses and all related programming as required for the proper operation of the respective security systems.
- G. The Contractor shall maintain a complete set of current and up to date set of shop drawings and equipment submissions at the job site at all times. The Shop drawings and all other submissions shall be marked up to reflect all as-built conditions and shall be made available for review by the Design Professional at request.

### **3.3 EQUIPMENT/CABLE INSTALLATION AND REQUIREMENTS**

- A. All system wiring and equipment installation shall be in accordance with good engineering practices and by all IEEE, TIA, NEC and manufacturer's requirements. Wiring shall comply with all state and local electrical codes. All wiring shall test free from all grounds, shorts, stray voltages and EMI.
- B. Follow manufacturers' instructions for installing, components and adjusting all equipment and cabling. Submit two (2) copies of such instructions to the Design Professional before installing any equipment. Provide a copy of such instructions at the equipment during any work on the equipment. Where no instructions are included with the equipment, follow accepted industry practices and workmanlike installation standards.
- C. Ensure that all security and video, systems cabling supports (conduits, support grips, cable tray and J-hooks) are fully installed before proceeding with cable installation. At no times shall any cables be installed and left unsupported. At no times shall cables be tie-wrapped to any other supporting structure in lieu of specified cable supports. Do not bundle or tie-wrap the cables even within the approved cable supports.
- 1. Do not leave any system cabling unprotected on the floor at any time. If cables must be left on any floor, protect the cables so that they may not be walked on or have any material or equipment placed or rolled on top. Replace all damaged cables from demarcation to termination point; no splicing of damaged cables shall be permitted.
  - 2. Maintain manufacturers recommended minimum bend radiuses of all cabling. Do not stretch, stress, tightly coil, bend or crimp the backbone, horizontal, patch or workstation cables. The Contractor shall keep all cabling out of the way of other trades during staging of any work. The Contractor at the Contractor's expense will replace all severely stressed or damaged cables, equipment and materials as determined by the Design Professional.
- D. Equipment location shall be as close as practical to locations as indicated on the contract drawings.
- 1. Provide all equipment clearances in accordance with NEC requirements. Arrange equipment to facilitate unrestricted access for maintenance and service around all equipment, components and/or cable terminations.

**E. Inaccessible Equipment:**

1. Where the Design Professional determines that the Contractor has installed equipment not conveniently accessible for operation and maintenance, the equipment shall be removed and reinstalled as directed at no additional cost to the project.
  - a. "Conveniently accessible" is defined as being capable of being reached without the use of ladders, or without climbing or crawling under or over obstacles such as, but not limited to, motors, pumps, belt guards, transformers, piping, ductwork, conduit and raceways.

**F. Cabling Requirements**

1. Contractors shall have the option to combine all home runs and conductors of same type and voltage "class" in accordance with NEC requirements unless specified elsewhere. Size all conduits and install all conductors in accordance with NEC requirements and manufacturers recommendations.
  - a. All TCP/IP based security system cabling is to be Category-6 and concealed above suspended ceilings, bundled and supported to the building structure. All cabling bundles shall be plenum rated and shall not contain any AC carrying conductors or non-associated security network cables. All TCP/IP based security cabling located above accessible suspended ceilings may be installed without conduit and shall be supported by "J" hooks.
    - 1) Cabling installed above inaccessible ceiling spaces shall be installed in dedicated conduits.
    - 2) No exposed cabling will be acceptable in finished or occupied spaces of the facility without approval by the Owner and Design Professional.
    - 3) Any CCTV, intercom or PACS system cabling installed exterior to the building and/or all cabling being routed from the facility to any remote location external to the project location shall be installed in fiber optic cable.
    - 4) Refer to related specification sections for additional information for additional information related to cabling types, sizes and testing requirements.

**G. Environmental Conditions**

1. Systems, components, devices materials and equipment shall be capable of withstanding the environmental conditions of the space without mechanical or electrical damage or degradation of operating capabilities or performance.
  - a. Interior, Controlled Environment: System components, installed in temperature-controlled interior environments shall be rated for continuous operation in ambient conditions of 2 to 50 deg C (36 to 122 deg F) dry bulb and 20 to 90 percent relative humidity, non-condensing and shall utilize NEMA 250, Type 1 enclosures.
  - b. Interior, Uncontrolled Environment: System components installed in non-temperature-controlled interior environments shall be rated for continuous operation in ambient conditions of -18 to 50 deg C (0 to 122 deg F) dry bulb and 20 to 90 percent relative humidity,

non-condensing and shall utilize NEMA 250, Type 4X enclosures.

- c. Exterior Environment: System components, conduits and back-boxes installed in locations exposed to weather shall be rated for continuous operation in ambient conditions of -34 to 50 deg C (-30 to 122 deg F) dry bulb and 20 to 90 percent relative humidity, condensing. Rated for continuous operation where exposed to rain as specified in NEMA 250, winds up to 137 km/h (85 mph) and snow cover up to 610 mm (24 in) thick shall utilize NEMA 250, Type 4X enclosures.
- d. Hazardous Environment: System components, conduits and back-boxes located in areas where fire or explosion hazards may exist because of flammable gases or vapors, flammable liquids, combustible dust, or ignitable fibers shall be rated, listed, and installed according to NFPA 70.
- e. Corrosive Environment: System components, conduits and back-boxes subjected to corrosive fumes, vapors, and wind-driven salt spray in coastal zones, shall utilize NEMA 250, Type 4X enclosures.
- f. Submersible Environment: System components, conduits and back-boxes subjected to prolonged submersion in water, shall utilize NEMA 250, Type 6P enclosures.
- g. Areas where equipment and devices may be subject to damage by the general population shall be installed in vandal resistant enclosures, all fire alarm devices shall be provided with wire guards.
- h. Console: All console equipment shall, unless noted otherwise, be rated for continuous operation under ambient environmental conditions of 15.6 to 29.4 deg C (60 to 85 deg F) and a relative humidity of 20 to 80 percent.

**H. Conduits/raceway/Cable Trays:**

- 1. All conduits/raceways shall be concealed and shall be installed above accessible finished ceilings and/or in walls. Any conduits/raceways installed in areas requiring installation to be exposed, shall be installed tight to ceilings at right angles to walls and shall not obstruct any access hatches, equipment service panels, lighting or other equipment and/or devices. No exposed conduits/raceways shall be installed without prior approval of the Design Professional prior to installation.
  - a. All raceways shall be supported in accordance with NEC requirements and shall be affixed in such a manner that tampering and/or removal by the general population without the use of specialized tools shall be prevented.
  - b. Outlet Boxes: shall be 4 x4 x 2-1/8 inches deep for all data jack locations and single gang for wall mounted telephone locations.
    - 1) All outlet boxes shall be provided with single or dual gang device mud-rings flush to finished wall as required based on type and configuration of outlet and type of wall construction.
    - 2) Use deep masonry boxes at masonry construction. T-Bar hangers or other appropriate mounting hardware shall be utilized to support boxes mounted in the ceiling.

**I. Penetrations of Walls and Floors**

- 1. All wall/floor penetrations are to be sleeved and fire stopped with approved fire stopping material. Coordinate all cable and conduit penetrations of the structure with all trades.
  - a. All penetrations of walls and floors shall be fire stopped in accordance with the

- ASTM and NFPA standards. Refer to related specification sections for additional information.
- b. Floor penetrations shall be sleeved with a minimum sleeve diameter of 4 inches. An additional penetration shall be provided for future use, sleeved and capped and fire stopped as required.
  - c. Coordinate size of wall penetration with conduit size, number of conductors. Comply with all NEC requirements.
  - d. The fire rating of all penetrated walls, floors, and ceiling structures shall be strictly maintained. All penetrations shall be fire-stopped and sealed by the Contractor.
  - e. Install fire-stopping in open penetrations and in the annular space of penetrations for fire rated barriers.
  - f. Installation of fire-stops shall be performed by an applicator/installer qualified and trained by the manufacturer. Installation shall be performed in strict accordance with manufacturer's detailed installation procedures.
  - g. Installation of all fire-stopping shall be in accordance with fire test reports, fire resistance requirements, acceptable sample installations, manufacturer's recommendations, local fire and building authorities, and applicable codes and shall be installed in a manner acceptable to the authority having jurisdiction.
- J. Transient Voltage Surge Suppression: All cables and conductors extending beyond building façade, except fiber optic cables, which serve as communications, control, or signal lines shall be protected against Transient Voltage surges and have Transient Voltage Surge Suppression (TVSS) protection.
1. The TVSS device shall be UL listed in accordance with Standard TIA 497B installed at each end. Lighting and surge suppression shall be a multi-strike variety and include a fault indicator.
  2. Protection shall be furnished at the equipment and additional triple solid state surge protectors rated for the application on each wire line circuit shall be installed within 914.4 mm (3 ft) of the building cable entrance. Fuses shall not be acceptable for surge protection applications. All inputs and outputs shall be tested in both normal mode and common mode to verify there is no interference at the minimum surge suppression test shall meet the following criteria.
    - a. All system power supplies serving exterior system components or devices shall be provided with the appropriate transient surge suppression protection on both the line side as well as the load side.
      - 1) A 10-microsecond rise time by 1000 microsecond pulse width waveform with a peak voltage of 1500 volts and a peak current of 60 amperes shall be the minimum performance requirements. Provide surge suppression in accordance with all manufacturers requirements.
      - 2) An 8-microsecond rise time by 20-microsecond pulse width waveform with a peak voltage of 1000 volts and a peak current of 500 amperes shall be the minimum performance requirements. Provide surge suppression in accordance with all manufacturers requirements.
      - 3) Maximum series current: 2 AMPS. Provide units manufactured by Advanced Protection Technologies, model #TE/FA 10B or TE/FA 20B or approved equal.
      - 4) Operating Temperature and Humidity: -40 to 85 deg C (-40 to 185 deg) shall be the minimum performance requirements. Provide surge

suppression in accordance with all manufacturers requirements.

### 3.4 GROUNDING AND BONDING

- A. All electronic equipment, conduits, cable trays, racks/cabinets and cable shields shall be properly grounded and bonded in accordance with all requirements of TIA 607-D, NEC 250 and IEEE 1100.
  - 1. All grounding connections shall provide the equalization of all grounding potentials between the building power system and the grounding terminations at the security equipment in order to provide the diversion of electrical transients as well as providing the necessary coupling in order to cancel and/or reduce any voltage transients.
    - a. Equipment Grounding: Metallic structures, equipment racks, cabinets and enclosures as well as all raceways, cable trays, junction boxes, outlet boxes, machine frames, and other conductive items shall be bonded and grounded.
  - 2. All connections of grounding conductors to ground rods, bus bars, rebar, structural members, pipes and fences, as well as splices of any ground conductors, shall be made by exothermic welds except where otherwise noted. All connections to bar lugs shall be exothermic weld or compression type connections. Bolted type connection of ground conductors may only be made where terminal lugs or blocks have been furnished and installed in equipment by the manufacturer.
    - a. Equipment grounding conductors shall be insulated stranded copper, except for sizes No. 10 AWG and smaller shall be solid copper. Insulation color shall be continuous green for all equipment grounding conductors, except that wire sizes No. 4 AWG and larger shall be permitted to be identified per the NEC.
      - 1) At the minimum bonding connection shall be a #6 AWG copper conductor. All grounding shall provide an effective bonding connection between the protected equipment to the nearest approved building grounding electrode (structural steel) as well as to the local power distribution panel grounding system (e.g., ac branch circuit panel board's equipment grounding busbar). All bonding and grounding connections shall be NEMA type compression or exothermic welded connections.
  - 3. Refer to related specification sections for any additional grounding and bonding requirements.

### 3.5 EQUIPMENT IDENTIFICATION

- A. Identify all system controls, components and equipment cabinets using plastic laminate engraved labels, or approved equal. Firmly affix to the panel, device and/or component.
  - 1. Nameplates shall be laminated black phenolic resin with a white core with engraved lettering, a minimum of 6 mm (1/4 inch) high. Secure nameplates with screws. Nameplates that are furnished by manufacturer as a standard catalog item or where other method of identification is herein specified. Dymo or Kroy tap adhesive backed lettering shall not be acceptable.
  - 2. Color-code all junction boxes and enclosures per NEC recommendations. At the minimum

provide all security junction boxes as follows:

- a. Color for Security circuits - Orange.
  - b. Color for CCTV circuits - Green
  - c. Color for Fire - Red.
  - d. Letter all pull boxes and junction boxes located in service area tunnels, above accessible ceilings and pipe chases with laminated black phenolic resin with a white core with engraved lettering, a minimum of 6 mm (1/4 inch) high. Secure nameplates with screws.
    - 1) Example: Security system "SS," Circuit Number SS-126.  
Engraved laminated plastic tags shall be used for identification and securely fastened in accordance with the project requirements.
3. Permanently label all wiring at both ends with self-adhering plastic labels.
  4. Provide typewritten circuit directories installed in 3-ring binders with transparent page protectors in each control and sub control cabinet and/or equipment rack.

### 3.6 MAINTENANCE & SERVICE

#### A. General Requirements

1. The Contractor shall provide all services required and equipment necessary to maintain the electronic security systems in an operational state as specified after formal written acceptance of the system.
  - a. Provide all necessary material required for performing scheduled adjustments or other non-scheduled work. Impacts on facility operations shall be minimized when performing scheduled adjustments or other non-scheduled work. Refer to Division 1 specification section for additional information.
  - b. The adjustment and repair of the security systems shall include all software and firmware up-dates on all computers, CPU's, HMI terminals, devices, communications and data transmission medias' (DTM), facility interface processors, signal transmission equipment, video surveillance and security management software and processors.
  - c. Test, inspect and service each system on a quarterly basis at three month intervals during the warranty period from the time of final acceptance. The Contractor shall compare each three month test results with the test results at the time of final acceptance.
    - 1) The Contractor shall include as part of the quarterly test the calibration and/or adjustment of any device, component and/or system that has deviated from the original test results at the time of final acceptance.
  - d. For each quarterly maintenance period, provide written notification to Owner of the systems condition before and after service, the exact components that were tested and serviced, and overall status of the system.

#### B. Personnel

1. Service personnel shall be manufacturer certified in the maintenance, testing and repair

of the type of system and equipment provided for the project. Provide the Owner and Design Professional the name of the designated service representative, and of any change in personnel. Owner and Design Professional shall be provided copies of system manufacturer certification for the designated service representative.

- a. Schedule of work to be performed during regular working hours, Monday through Friday, excluding federal holidays.

**C. Emergency Service**

1. Owner shall initiate service calls whenever the system is not functioning properly. The Contractor shall provide the Owner with an emergency service center telephone number. The emergency service center shall be staffed 24 hours a day 365 days a year. Owner shall have sole authority for determining catastrophic and non-catastrophic system failures.

- a. For catastrophic system failures, the Contractor shall provide same day eight (8) hour service response with a defect correction time not to exceed sixteen (16) hours from [notification] [arrival on site]. Catastrophic system failures are defined as any system failure that Owner determines will place the facility(s) at increased risk.
- b. For non-catastrophic failures, the Contractor within 1 business day with a defect correction time not to exceed 48 hours from time of notification.

**D. Records & Logs**

1. The Contractor shall maintain records and logs of each task and organize cumulative records for each component and for the complete system chronologically. A continuous log shall be submitted for all devices. The log shall contain all initial settings, calibration, repair, and programming data. Complete logs shall be maintained and available for inspection on site, demonstrating planned and systematic adjustments and repairs have been accomplished for the system.

**E. Work Request**

1. The Contractor shall separately record each service call request, as received. The record shall include the serial number identifying the component involved, its location, date and time the call was received, specific nature of trouble, names of service personnel assigned to the task, instructions describing the action taken, the amount and nature of the materials used, and the date and time of commencement and completion. The Contractor shall deliver a record of the work performed within five (5) working days after the work was completed.

**F. System Modifications**

1. The Contractor shall make any recommendations for system modification in writing to the Design Professional. No system modifications, including operating parameters and control settings, shall be made without prior written approval from the Design Professional. Any modifications made to the system shall be incorporated into the operation and maintenance manuals and all related documentation.

**3.7 WARRANTY**

- A. Warrant material and workmanship for a period as specified in Division 1 of the contract documents and all related specification sections. The warranty period shall commence from the date the Contractor received written notification of final acceptance from the Design Professional. At the minimum the Contractor shall provide warranty provisions:
1. Warrant the replacement of defective components/materials and/or correct defective work when given notice by Owner during the warranty period.
  2. Warranty excludes liability for consequential incidental, or special damages due to vandalism, misuse, or acts of God.
  3. Onsite warranty response time by qualified technician shall be within 8 hours upon receipt of request from Owner.
  4. Warranty repairs shall be provided to Owner at no cost. This shall include but not limited to all repairs and/or replacement of defective components/materials, all labor charges, all travel costs and all vehicle charges.
  5. Response time shall be 7 days a week / 24 hours a day / 365 days a year.
  6. Provide test, inspection and service of each system on a quarterly basis at three month intervals.
  7. Contractor must provide verification that they maintain their principal base of operation along with the personnel that will be responsible for providing service within 3 hours driving time to the project site. This tenet of the warranty shall remain in effect for the life of the warranty.
  8. All TCP/IP based security communications cabling and related appurtenances shall be provided with the manufacturers 25 year extended warranty in addition to all requirements above.
- B. The Contractor shall, as a condition of final payment, execute a written warranty certifying all contract requirements have been completed according to all requirements of the Contract Documents.
1. All system testing, commissioning, demonstration and training shall be performed prior to final system acceptance. All defects or damages due to faulty materials or workmanship shall be repaired or replaced without delay, to the satisfaction of the Owner and Design Professional, at the Contractor's expense.
    - a. The Contractor shall provide written documentation of test results and stating what was done to correct any deficiencies. The first inspection shall occur 90 calendar days after the acceptance date. The last inspection shall occur 30 calendar days prior to the end of the warranty.
    - b. The warranty period shall be extended until the last inspection and associated corrective actions are complete. When equipment and labor covered by the Contractor's warranty, or by a manufacturer's warranty, have been replaced or restored because of its failure during the warranty period, the warranty period for any replaced or repaired equipment or restored work shall be reinstated for a period equal to the original warranty period, and commencing with the date of completion of the replacement or restoration work.
  2. In the event any manufacturer customarily provides a warranty period greater than one (1) year, the Contractor's warranty shall be for the same duration for that component.

### 3.8 FIELD SERVICES

- A. Notify Owner and Design Professional in writing, ten days advance of testing of all system cabling to prevent delays in construction schedules.
1. Test all cabling to confirm that no grounds, shorts, sneak currents, RFI and EMI conditions exist prior to start-up and commissioning of all, components, devices, equipment and/or systems.
    - a. Before requesting a final inspection, the Contractor shall perform a series of end to end installation performance tests. The Contractor shall submit for approval by Design Professional all test procedures to be employed, test result forms, and timetable for testing all fiber optic and copper plant wiring.
    - b. Acceptance of the simple test procedures discussed below is predicated on the Contractor's use of the recommended products including but not limited to twisted pair cable, cross-connect blocks, and outlet devices specified and adherence to the inspection requirements and practices set forth. Acceptance of the completed installation will be evaluated in the context of each of these factors.
  2. Perform all tests, as required, by authorities having jurisdiction throughout the facility.
  3. Testing of all electronic security systems shall be in the presence of the Owner and Design Professional as well as all appropriate representatives of the authorities having jurisdiction.
    - a. All completed the security systems shall be fully tested in accordance with all requirements of NFPA 731. Upon completion of a successful testing, the Contractor shall so certify in writing to Owner and Design Professional that all testing was completed, certified and left in first class operational condition, include all completed NFPA 731 certification and test reports.
    - b. The service of a competent, factory-trained engineer or technician authorized by the equipment manufacturer shall be provided to technically supervise installation and participate during initial system programming, start-up, final testing, assist in the final acceptance testing and Owner demonstrations.
    - c. At the minimum all acceptance testing, demonstrations and training shall include, but not be limited to the following:
      - 1) Security Monitoring/Control Systems
      - 2) CCTV Surveillance System Performance and Functions
      - 3) Remote Security Monitoring/Control Systems
      - 4) CCTV Surveillance System programming and configurations
      - 5) UPS and Battery Back-up Functions.
      - 6) Integration of all Auxiliary Systems
  4. In addition, provide all testing, commissioning and certifications as specified by Division 1 specification sections and any manufacturer's recommendations or requirements.
- B. Training
1. In addition to all demonstration and training as specified by Division 1 specification section and all related Division 28 specification sections, system demonstrations and training shall be provided in accordance with all requirements of this section.

2. Prior to acceptance of the work, the System Integrator shall demonstrate to the Owner and Design Professional, all systems and sub-systems all features and functions of each system and shall instruct Owner Representatives in the proper operation, event sequences, programming and maintenance of all systems and sub-systems.
  3. The System Integrator shall furnish the necessary trained personnel to perform all demonstrations and instructions and arrange to have the manufacturer's representatives present to assist with the demonstrations.
  4. Training time shall include, as a minimum, the total time determined by the sum of the times per system as specified in this and related specification sections, for performing the prescribed demonstrations/training. Refer to related specification sections for additional training requirements.
    - a. Allow a minimum of 16 hours' time for each system provided for performing the prescribed demonstrations/training.
      - 1) Provide a minimum of (4) four 4-hour training classes performed at the project location and spaced over a three week interval. Training classes shall be scheduled not less than 48 hours apart to allow Owner User\Operators to familiarize themselves with all system operations.
  5. Provide operation, parts and maintenance manuals defining operation and troubleshooting methods of all systems and review with Owner User\Operators as part of training demonstrations.
  6. Provide detailed video recordings in high quality digitally formatted media of all demonstration and training of all systems and system operations.
    - a. Utilize remote microphones as may be required to ensure high quality audio of the recorded demonstrations.
    - b. Permanently and professionally label all recorded materials and provide self-sealing plastic cases.
- C. Inspections
1. At the completion of the project and prior to final acceptance of the Work, provide evidence of final inspections and approvals to the Owner and Design Professional, as required by the authorities having jurisdiction as well as all requirements of Division 01 specification sections.

**END OF SECTION 28 05 00**

**SECTION 28 13 00**

**ACCESS CONTROL**

**PART 1 - GENERAL**

**1.1 STIPULATIONS**

- A. Project drawings and general provisions of the Contract, including but not limited to all; General and Supplementary Conditions, Division 01 Specification Sections and all stipulated Specification Sections shall apply to this and all related Division 27 specification sections.

B. Related Sections:

1. Division 07 – Through-penetration Firestop Systems
2. Division 26 – Common Work Results for Electrical
3. Division 26 – Low Voltage Electrical Power Conductors and Cables
4. Division 26 – Grounding and Bonding for Electrical Systems
5. Division 26 – Hangers and Supports for Electrical Systems
6. Division 26 – Raceways and Boxes for Electrical Systems
7. Division 26 – Identification for Electrical Systems
8. Division 27 – Common Work Elements for Communications Systems
9. Division 27 – Audiovisual Systems
10. Division 28 – Common Work Elements for Electronic Safety and Security
11. Division 28 – Access Control
12. Division 28 – Video Surveillance System

C. Reference Symbols:

1. All device symbols are defined by the appropriate symbol schedules. Because of the scale of the drawings, symbols are shown on drawings as close as possible to the mounting location.
  - a. Contractor shall coordinate exact locations with all architectural drawings, site plans, reflected ceiling plans, furniture plans, mechanical and electrical drawings as well as all affected trades prior to submittal of any shop drawings.

D. Abbreviations:

1. Refer to Specification Section 28 05 00 for additional information.

E. Definitions:

1. Refer to Specification Section 28 05 00 for additional information.

**1.2 SUMMARY**

A. Section Includes:

1. The Contractor shall include in the bid all labor, materials, tools, plant, transportation, storage costs, software/licenses, installation, programming, configuration, testing,

- commissioning, training, equipment, insurance, temporary protection, permits, fire stopping, inspections, taxes and all necessary and related items required to provide complete and operational equipment / systems shown and described in this section and matching the scope of responsibilities schedule indicated in the security drawing package.
2. This section is intended to define and describe minimum security system performance, required vendors and equipment, and installation standards and criteria.
  3. All equipment and materials provided shall be new and unused and of the most current model or revision. All components of this system shall be installed in a workmanlike manner, following security industry "best practices" and in strict adherence to the manufacturer's specifications and applicable codes.
  4. All Security System design guides, schematic designs, design development documents, device location maps, system records, record documents, operating instructions, and emergency response procedures are extremely confidential. Access to these documents shall be restricted to authorized personnel, the Security System Contractor(s), and approved vendors providing associated services. Parties receiving these documents shall take every reasonable precaution to protect these documents from unauthorized access.
  5. Failure to follow manufacturer guidelines or the substitution of non-approved equipment or materials shall result in the rejection of the installation and shall require remediation efforts.
  6. The Security Contractor shall furnish and install all equipment, accessories and materials in accordance with these specifications and drawings to provide a complete and operating security access and surveillance system.
  7. Any material and/or equipment necessary for the proper operation of the surveillance system not specified or described herein shall be deemed part of this specification.
  8. Final approval and acceptance of the installed systems rests solely with Owner's Facility and Security personnel.

### 1.3 DESCRIPTION OF WORK

- A. Provide all labor, materials, equipment, services and accessories necessary to furnish and install the work of this Section, complete and functional, as indicated in the contract documents and as specified herein.
- B. The following standards, requirements, and equipment access control and video management systems shall be installed:
  1. Networked nodes and panels, configured with the appropriate access, alarm input, and temperature probe application blades.
  2. Lock power supplies, 24VDC, with fused protected outputs.
  3. Systems controller with partitioning feature.
  4. Integration with the building's fire alarm system to release fail-safe locks upon activation of the fire detection system.
  5. Doors identified on the drawings as an access control portal shall include at least one P o E card reader with integral electric door hardware, and door status switch. Additional components, including external request-to-exit devices and push-to-exit emergency buttons, may also be required for specific applications.
  6. The access control system is a network device and will be terminated in dedicated patch panels in the MDF/IDF.

7. Security Contractor shall provide and install individual patch cables between the Data Outlet and the Network Node. Coordinate with Telecommunications Contractor. Data outlet shall be installed inside Network Node panel enclosure.

#### 1.4 SUBMITTALS

- A. Product Data: For each type of product indicated.
- B. Submittals shall include information that confirms compliance with contract requirements. Include the manufacturer's name, model numbers, technical data sheets, and shop drawings as required.
- C. All submittals shall include adequate descriptive literature, catalog cuts, shop drawings and other data necessary for Owner and Engineer to ascertain that the proposed equipment and materials comply with specification requirements. Catalog cuts submitted for approval shall be legible and clearly identify equipment being submitted.
- D. Shop Drawings: Include plans, elevations, sections, details, and attachments to other work.
  1. Wiring Diagrams
  2. System labeling schedules.
  3. Cable administration drawings.
  4. Battery and charger calculations for central station, workstations, and controllers.

#### 1.5 INFORMATIONAL SUBMITTALS

- A. Field quality-control reports.

#### 1.6 CLOSEOUT SUBMITTALS

- A. Operation and Maintenance Data: For security system to include in emergency, operation, and maintenance manuals. In addition to items specified in Section "Operation and Maintenance Data," include the following:
  1. Hard copies of manufacturer's specification sheets, operating specifications, design guides, user's guides for software and hardware supplied under this contract, and PDF files of the hard-copy submittal.
  2. System installation and setup guides with data forms to plan and record options and setup decisions. Submit manufacturer's operation and maintenance data, customized to the specified systems installed. Include system and operator manuals. Training of staff on hardware and software functions.
  3. Maintenance Service Agreement: Submit a sample copy of the manufacturer's maintenance service agreement, including cost and services for a one-year period for Owner's review.
- B. Record Drawings: During construction maintain record drawings indicating location of equipment and wiring. Submit an electronic version of record drawings for the specified systems no later than Substantial Completion of the project. Project record drawings shall accurately show the physical placement of the following:
  1. Equipment and devices.

2. Interfaces to fire alarm system and other external systems.

#### 1.7 QUALITY ASSURANCE

- A. Electrical Components, Devices, and Accessories: Listed and labeled as defined in NFPA 70, by a qualified testing agency, and marked for intended location and application.
- B. Comply with NFPA 70, National Electrical Code; SIA CP-01, and SIA CP-07.
- C. The Contractor shall be responsible for providing, installing, and configuring the access control and video surveillance systems as shown. The Contractor shall also provide certification as required.
- D. The access control and video surveillance systems will be installed and tested to ensure all components are fully compatible as a system and can be integrated with all associated security subsystems.
- E. Manufacturers Qualifications: The manufacturer shall regularly and presently produce, as one of the manufacturer's principal products, the equipment and material specified for this project, and shall have manufactured the item for at least three years.
- F. Product Qualifications:
  1. Manufacturer's product shall have been in satisfactory operation, on three installations of similar size and type as this project, for approximately three years.
  2. Owner reserves the right to require the Contractor to submit a list of installations where the products have been in operation before approval.
- G. Contractor Qualifications:
  1. The Security Contractor shall be a licensed Security Contractor with a minimum of five (5) years' experience installing and servicing systems of similar scope and complexity.
  2. The Contractor shall be an authorized regional representative of the system approved for installation. The Contractor shall provide four (4) current references from clients with systems of similar scope and complexity which became operational in the past three (3) years. At least three (3) of the references shall be utilizing the same system components, in a similar configuration as the proposed system. The references must include a current point of contact, company or agency name, address, telephone number, complete system description, date of completion, and approximate cost of the project.
  3. Owner reserves the option to visit the reference sites, with the site Owner's permission and representative, to verify the quality of installation and the references' level of satisfaction with the system.
  4. The Contractor shall only utilize factory-trained technicians to install, program, and service the specified systems. The Contractor shall only utilize factory-trained technicians to install, terminate and service controller/field panels and reader modules.
  5. The technicians shall have a minimum of five (5) continuous years of technical experience in electronic security systems. The Contractor shall have a local service facility.

- H. Service Qualifications: There shall be a permanent service organization maintained or trained by the manufacturer which will render satisfactory service to this installation within four hours of receipt of notification that service is needed.

- I. Pre-installation Conference: Conduct conference at project site.

## 1.8 PROJECT CONDITIONS

- A. Environmental Conditions: System shall be capable of withstanding the following environmental conditions without mechanical or electrical damage or degradation of operating capability:
  - 1. Indoor, Controlled Environment: NEMA 250, Type 1 enclosure. System components, except the central-station control unit, installed in temperature-controlled indoor environments shall be rated for continuous operation in ambient conditions of 36 to 122-degree F dry bulb and 20 to 90 percent relative humidity, non-condensing.
  - 2. Indoor, Uncontrolled Environment: NEMA 250, enclosures. System components installed in non-temperature-controlled indoor environments shall be rated for continuous operation in ambient conditions of 0 to 122-degree F dry bulb and 20 to 90 percent relative humidity, non-condensing.

## 1.9 WARRANTY

- A. Submit sample of manufacturer's warranty and documentation of final executed warranty completed in Owner's name and registered with manufacturer.
- B. Warranty Period: One year from date of completion.

## **PART 2 - PRODUCTS**

### 2.1 DESCRIPTION:

- A. Security Access System: Subject to compliance with requirements, provide product indicated on Drawings. The access control system for this location shall be an extension of the existing campus platform. Refer to SC series drawings for furnish and installation responsibilities for cabling and access control active equipment.

### 2.2 ACCESS CONTROL AND INTERCOM EQUIPMENT

- A. All access control and intercom active equipment to be Owner furnished and Contractor installed using Contractor provided access control cabling where required on the SC series drawings.

### 2.3 PUSH-BUTTON SWITCHES

- A. Push-Button Switches:
  - 1. Momentary-contact mushroom-type push buttons with stainless-steel switch enclosures.
  - 2. Single gang, with "PUSH TO EXIT" knob, Green in color.
  - 3. Push-button switches shall be powered from their associated controller, using DC power.

4. Push-button switches shall be equipped with an adjustable 1 to 45 second pneumatic time delay.

**B. Mounts**

1. Flush or surface mounting.
2. Push buttons shall be suitable for flush mounting in the switch enclosures.
3. Enclosures shall additionally be suitable for installation in a controlled and uncontrolled indoor environment.

**C. Manufacturer: Dortronics 5236 Series or approved equal.**

**2.4 DOOR HARDWARE INTERFACES**

- A. All hardware interfaces shall be integral to the PoE access control device unless otherwise indicated on the SC series drawing set.

**2.5 FIRE ALARM INTERFACE:**

- A. The Fire Alarm Contractor shall provide fire alarm relays at all doors. The relay shall be mounted on the secure side of the door, above the ceiling.
- B. The Security Contactor shall provide an interconnection between the fire alarm relay and each door controller. The purpose of the interconnection is to drop power to all fail-safe locks upon activation of the fire detection system.

**2.6 CABLES**

- A. General Cable Requirements: Comply with requirements in Division 28 Section "Conductors and Cables for Electronic Safety and Security" and as recommended by system manufacturer for integration requirement.

**B. Plenum-Type, TIA 485-A Cables:**

1. Two pairs, No. 22 AWG, stranded tinned copper conductors, fluorinated-ethylene-propylene insulation, unshielded, and fluorinated-ethylene-propylene jacket.
2. NFPA 70, Type CMP.
3. Flame Resistance: NFPA 262 flame test.
4. Manufacturer: Belden or approved equal.

**C. Multi-Conductor Reader Cable:**

1. Cable shall be Siamese type composite cable, with multiple sheaths under a common jacket:
  - a. Elem1: 22/1P Conductor Shielded, Lo-Cap, Tinned Copper, RS-485, 120 Ohms;+ 18-02 Conductor Non-Shielded, Bare Copper White Jacket with no Stripe
  - b. Elem2: 18-04 Conductor Non-Shielded, Bare Copper White Jacket with Orange Stripe;
  - c. Elem3: 22-04 Conductor Non-Shielded, Bare Copper White Jacket with Red Stripe;

- d. Elem4: 22-02 Conductor Non-Shielded, Bare Copper White Jacket with Green Stripe NFPA 70, Type CMP.
- 2. Windy City Wire Part No. 4461030-OSDP or approved equal.

### **PART 3 - EXECUTION**

#### **3.1 EXAMINATION**

- A. Examine pathway elements intended for cables. Check raceways, cable trays, and other elements for compliance with space allocations, installation tolerances, hazards to cable installation, and other conditions affecting installation.
- B. Examine roughing-in for conduits and pathways for access control cabling and conduit at PCs, controllers, card readers, and other cable-connected devices to verify actual locations of conduit and back boxes before device installation.
- C. Proceed with installation only after unsatisfactory conditions have been corrected.

#### **3.2 PREPARATION**

- A. Comply with recommendations in SIA CP-01 and CP-07.
- B. Comply with ANSI/TIA 606-C, "Administration Standard for Commercial Telecommunications Infrastructure."
- C. Obtain detailed project planning forms from manufacturer of access-control system; develop custom forms to suit Project. Fill in all data available from Project plans and specifications and publish as Project planning documents for review and approval.
  - 1. Record setup data for control station and workstations.
  - 2. For each Location, record setup of controller features and access requirements.
  - 3. Propose start and stop times for time zones and holidays and match up access levels for doors.
  - 4. Set up groups, facility codes, linking, and list inputs and outputs for each controller.
  - 5. Assign action message names and compose messages.
  - 6. Set up alarms. Establish interlocks between alarms, intruder detection, and video surveillance features.
  - 7. Prepare and install alarm graphic maps.
  - 8. Develop user-defined fields.
  - 9. Develop screen layout formats.
  - 10. Propose setups for guard tours and key control.
  - 11. Discuss badge layout options; design badges.
  - 12. Complete system diagnostics and operation verification.
  - 13. Prepare a specific plan for system testing, startup, and demonstration.
  - 14. Develop acceptance test concept and, on approval, develop specifics of the test.
- D. In meetings with Architect and Owner, present project planning documents and review, adjust, and prepare final setup documents. Use final documents to set up system software.

### 3.3 INSTALLATION REQUIREMENTS

- A. Security Systems Contractor shall execute their work in a neat and skillful manner.
- B. The Security Systems Contractor shall provide all wiring, connectors, power supplies, interfaces, and other hardware as necessary to affect an operating system unless specified as being provided by others in the contract drawings and documents.
- C. Wiring and cabling shall be in conduit where exposed to physical damage or tampering. Method and routing of any exposed raceways and/or wiring shall be approved by Owner prior to installation.
  - 1. Cable that is concealed within building structure or above suspended ceilings shall not require conduit.
  - 2. Cable that is not accessible due to location or which is installed at or below the roof deck must be attached to the building structure or structural steel using approved hangers, straps, or other suitable methods. Cables shall not rest directly upon structural steel members or suspended ceiling assemblies.
- D. System components and control devices shall be wired to the appropriate power supply, Network Node, and PoE switch as homeruns. Terminations shall be made in a manner consistent with the equipment manufacturer's written installation instructions.
- E. Conductors and cables shall be specified and sized to reduce voltage drop and ensure proper system operation.
  - 1. Data communications wiring to each door shall be Plenum-rated Category 6, as installed by Division 27 Contractor.
- F. All cable shall be labeled at origin and termination, referencing to a master legend schedule shown on submittal drawings. Labeling and any splice locations shall be noted on Record Drawings.
- G. Security Contractor shall provide trim plates, adapters or back boxes for card readers as needed to mount to electrical back boxes. The color and finish of all trim plates, adapters or back boxes used shall closely match that of the card reader.
- H. Completely seal all exterior openings of outdoor mounted devices and back boxes to make weather-tight.
- I. Miscellaneous hardware required for installation shall be suitable for the purpose for which it is used. Hardware includes nuts, bolts, screws, washers, miscellaneous fasteners, terminals, terminal strips, tie wraps, and related parts. Where the equipment manufacturer specifies hardware for use in the installation, the hardware specified shall be used. The finish on all hardware and fasteners shall be suitable for the environment in which it will be used and shall be selected to minimize corrosion or deterioration due to moisture, sunlight, or temperature extremes.
- J. All electrical power work and conduit work shall be by licensed electricians.

- K. The Security Systems Contractor will be required to install and test local equipment, programming it with an IP address specified by Owner. In all circumstances, the Security Systems Contractor's work shall not be considered complete until the equipment has been programmed and tested to the satisfaction of Owner.

### 3.4 CABLING

- A. Comply with NECA 1, "Good Workmanship in Electrical Construction."
- B. Furnish and install cables and wiring in accordance with these specifications and the requirements in Section 280513 "Conductors and Cables for Electronic Safety and Security."
- C. Wiring Method: Install wiring in raceway and cable tray except within consoles, cabinets, desks, and counters. Conceal raceway and wiring except in unfinished spaces.
- D. Wiring Method: Install wiring in raceway and cable tray except within consoles, cabinets, desks, and counters, and except in accessible ceiling spaces and in gypsum board partitions where unenclosed wiring method may be used. Use UL-listed plenum-rated cable in environmental airspaces, including plenum ceilings. Conceal raceway and cables except in unfinished spaces.
- E. Boxes and enclosures containing security-system components or cabling, and which are easily accessible to employees or to the public, shall be provided with a lock. Boxes above ceiling level in occupied areas of the building shall not be considered accessible.
- F. Junction boxes and small device enclosures below ceiling level and easily accessible to employees or the public shall be covered with a suitable cover plate and secured with tamperproof screws.
- G. Furnish and install end-of-line resistors at the field device location, not at the controller or panel location.

### 3.5 CABLE INSTALLATION

- A. Comply with ANSI/TIA-569-E, "Commercial Building Standard for Telecommunications Pathways and Spaces."
- B. Cable application requirements are minimum requirements and shall be exceeded if recommended or required by manufacturer of system hardware.
- C. TIA 232-F Cabling: Cabling between devices shall not exceed 50 feet, or distance allowed by equipment manufacturer.

### 3.6 GROUNDING

- A. Comply with Division 26 "Grounding and Bonding for Electronic Safety and Security."
- B. Comply with IEEE 1100, "Recommended Practice for Power and Grounding Electronic Equipment."

- C. Ground cable shields, drain conductors, and equipment to eliminate shock hazard and to minimize ground loops, common-mode returns, noise pickup, cross talk, and other impairments.
- D. Bond shields and drain conductors to ground at only one point in each circuit.
- E. Signal Ground:
  - 1. Terminal: Locate in each equipment room and wiring closet; isolate from power system and equipment grounding.
  - 2. Bus: Mount on wall of main equipment room with standoff insulators.
  - 3. Backbone Cable: Extend from signal ground bus to signal ground terminal in each equipment room and wiring closet.

### 3.7 INSTALLATION

- A. Furnish and install card readers, keypads, magnetic locks, push buttons, door contacts, and request-to-exit devices. Provide connectivity to these devices if these devices have been furnished as part of the door hardware.

### 3.8 IDENTIFICATION

- A. In addition to requirements in this article, comply with applicable requirements in Section 260553 "Identification for Electrical Systems" and with ANSI/TIA-606C.
- B. Develop and provide as-built device and cable administration drawings for system identification, testing, and management. Use unique, alphanumeric designation for each cable, and label cable and jacks, connectors, and terminals to which it connects with the same designation. Use logical and systematic designations for facility's architectural arrangement.
- C. Label each terminal strip and screw terminal in each cabinet, rack, or panel.
  - 1. All wiring conductors connected to terminal strips shall be individually numbered, and each cable or wiring group being extended from a panel or cabinet to a building-mounted device shall be identified with the name and number of the particular device as shown.
  - 2. Each wire connected to building-mounted devices is not required to be numbered at the device if the color of the wire is consistent with the associated wire connected and numbered within the panel or cabinet.
- D. At completion, as-built drawings and information provided by the Contractor shall reflect as-built conditions.

### 3.9 SYSTEM SOFTWARE AND HARDWARE

- A. Configure and test software and hardware and perform database tests for the complete and proper operation of systems involved. Assign software license to Owner.

### 3.10 FIELD QUALITY CONTROL

- A. Perform tests and inspections.

1. Manufacturer's Field Service: Engage a factory-authorized service representative to inspect components, assemblies, and equipment installations, including connections, and to assist in testing.
2. Test each circuit and component of each system. Tests shall include, but are not limited to, measurements of power-supply output under maximum load, signal loop resistance, and leakage to ground where applicable. System components with battery backup shall be operated on battery power for a period of not less than 10 percent of the calculated battery operating time. Provide special equipment and software if testing requires special or dedicated equipment.
3. Operational Test: After installation of cables and connectors, demonstrate product capability and compliance with requirements. Test each signal path for end-to-end performance from each end of all pairs installed. Remove temporary connections when tests have been satisfactorily completed.

B. Devices and circuits will be considered defective if they do not pass tests and inspections.

C. Prepare test and inspection reports.

### 3.11 STARTUP SERVICE

A. Engage a factory-authorized service representative to supervise and assist with startup service.

1. Complete installation and startup checklists according to approved procedures that were developed in "Preparation" Article and with manufacturer's written instructions.
2. Enroll and prepare badges and access cards for Owner's operators, management, and security personnel.

B. Train Owner's maintenance personnel on equipment operation, startup and shutdown, troubleshooting, servicing and preventative maintenance procedures. Review the data contained in the Operating and Maintenance Manuals with Owner's personnel. Training shall occur separate from startup activities. Provide 4 hours of training minimum.

### 3.12 PROTECTION

A. Maintain strict security during the installation of equipment and software. Rooms housing the control stations and workstations that have been powered up shall be locked and secured with an activated security system reporting to a central station complying with UL 1610, "Central-Station Burglar-Alarm Units", during periods when a qualified operator in the employ of Contractor is not present.

### 3.13 DEMONSTRATION

A. Engage a factory-authorized service representative to train Owner's maintenance personnel to adjust, operate, and maintain security access system.

B. Develop separate training modules for the following:

1. Computer system administration personnel to manage and repair the LAN and databases and to update and maintain software.
2. Operators who prepare and input credentials to man the control station and workstations and to enroll personnel.

3. Security personnel.
4. Hardware maintenance personnel.
5. Corporate management.

**3.14 FINAL ACCEPTANCE**

- A. After work is completed, and prior to requesting the Final Acceptance Test, Security Contractor shall conduct a final inspection and pre-test all equipment and system features. Contractor shall correct any deficiencies discovered as the result of the inspection and pre-test.
- B. Contractor shall notify Owner and Engineer to schedule a Final Acceptance Test. The request for Acceptance Test shall constitute a certification from the Security Contractor that all work is complete and in compliance with the Contractor Documents, all systems have been tested, and all corrections have been made.
- C. Technicians performing the acceptance test shall have been involved in the installation of the system and shall be thoroughly familiar with all aspects of the work.
- D. Security Contractor shall provide all ladders, tools, test equipment as needed to accomplish the Final Acceptance Test.
- E. Any portions of the work found to be deficient or not in compliance with the Contract Documents will be rejected.

**END OF SECTION 28 13 00**

**SECTION 28 23 00**

**VIDEO SURVEILLANCE SYSTEM**

**PART 1 - GENERAL**

**1.1 STIPULATIONS**

- A. The specifications sections "General Conditions of the Construction Contract", "Special Conditions", and "Division 1 - General Requirements" form a part of this Section by this reference thereto and shall have the same force and effect as if printed herewith in full.
- B. Related Sections:
  - 1. Division 07 – Through-penetration Firestop Systems
  - 2. Division 26 – Common Work Results for Electrical
  - 3. Division 26 – Low Voltage Electrical Power Conductors and Cables
  - 4. Division 26 – Grounding and Bonding for Electrical Systems
  - 5. Division 26 – Hangers and Supports for Electrical Systems
  - 6. Division 26 – Raceways and Boxes for Electrical Systems
  - 7. Division 26 – Identification for Electrical Systems
  - 8. Division 27 – General Requirements for Telecommunications
  - 9. Division 27 – Common Work Elements for Communications Systems
  - 10. Division 27 – Network Communications Systems
  - 11. Division 27 – Two-Way Communications System
  - 12. Division 27 – Audiovisual Systems
  - 13. Division 28 – Common Work Elements for Electronic Safety and Security
  - 14. Division 28 – Physical Electronic Safety and Security
  - 15. Division 28 – Video Surveillance System
- C. Reference Symbols:
  - 1. All device symbols are defined by the appropriate symbol schedules. Because of the scale of the drawings, symbols are shown on drawings as close as possible to the mounting location.
    - a. Contractor shall coordinate exact locations with all architectural drawings, site plans, reflected ceiling plans, furniture plans, mechanical and electrical drawings as well as all affected trades prior to submittal of any shop drawings.
- D. Abbreviations:
  - 1. Refer to Specification Section 28 05 00 for additional information.
- E. Definitions:
  - 1. Refer to Specification Section 28 05 00 for additional information.

**1.2 SUMMARY**

- A. The intent of this specification is to establish a standard of quality, overall system configuration and equipment requirements for the installation of a new TCP/IP-based Video Surveillance System (CCTV). The Contractor shall be responsible for providing all design, installation, programming, commissioning, testing and certifications as necessary to provide a complete, fully integrated and operating TCP/IP-based Video Surveillance System in accordance with the Contract Drawings and/or as herein specified.
- B. The installation, performance, features, functions, software and programming criteria as specified herein as well as all related specification sections have been designed to offer the maximum system efficiency ease of operation, occupant safety and the protection of equipment as recommended.
  - 1. The scope of work for this project shall include but not limited to providing all necessary conduits, cabling, equipment, components, devices, network video recorders, materials, active network electronics, integration of existing surveillance cameras and ancillary systems in order to provide a seamless and fully integrated video management system.
  - 2. In addition, the video management system platform shall also be fully integrated in a seamless manner with the Stations' new Physical Access Control System (PACS) providing a secondary platform with full operational control and monitoring of all video surveillance system cameras, network recorders and all system functions accessible from the PACS client workstations.
  - 3. The integration to the PACS shall permit system operators to monitor/control and trigger specific surveillance cameras, video monitors and video recordings as well as all related events and alarms annunciated by the physical access control, intrusion detection and emergency call systems.
  - 4. The PACS workstation shall provide a graphical display of all events, controls and functions for all video surveillance system functions and features. Surveillance systems which Do Not conform to the performance criteria or Do Not provide for all functional and operational capabilities in a seamless manner through the PACS platform shall not be acceptable. Refer to all related specification sections for additional information.

### 1.3 REFERENCES

- A. The publications listed below (including amendments, addenda, revisions, supplement, and errata) shall form a part of this specification to the extent referenced. The publications are referenced in the text by the basic designation only.
  - 1. Closed Circuit Television Manufacturers Association (CCTMA).
  - 2. Open Network Video Interface Forum (ONVIF)
- B. All references to industry and trade association standards as well as all building codes are minimum installation requirements for this system. The codes, standards and agencies listed in specification section 28 05 00 shall form a part of this specification section and all work shall comply with the latest adopted standards.
  - 1. The publications listed in specification section 28 05 00 (including all amendments, addenda, revisions, supplement, and errata) shall form a part of this specification section to the extent referenced. The publications are referenced in the aforementioned

specification section by the basic designation only.

2. Where the contract drawings and/or specification sections mandate a greater requirement or performance than those specified by the aforementioned referenced codes and standards in section 28 05 00, shall then be the governing requirements for this project. Refer to specification section 28 05 00 for all minimum codes and standards to be applied for this project.

#### 1.4 SUBMITTALS

- A. In addition to all requirements as specified by Specification Section 28 05 00 the video surveillance system shall also be provided in accordance with the following requirements:
  1. Product Data: For each type of product indicated. Include dimensions and data on features, performance, electrical characteristics, ratings, and finishes.
  2. Shop Drawings: For video surveillance. Include plans, elevations, sections, details, and attachments to other work.
  3. Detail equipment assemblies and indicate dimensions, weights, loads, required clearances, method of field assembly, components, and location and size of each field connection.
  4. Functional Block Diagram: Show single-line interconnections between components for signal transmission and control. Show cable types and sizes.
  5. Dimensioned plan and elevations of equipment racks, control panels, and consoles. Show access and workspace requirements.
  6. UPS: Sizing calculations.
  7. Wiring Diagrams: For power, signal, and control wiring.
- B. Equipment List: Include every piece of equipment by model number, manufacturer, serial number, location, and date of original installation.

#### 1.2 CLOSEOUT SUBMITTALS

- A. Operation and Maintenance Data

#### 1.3 QUALITY ASSURANCE

- A. Electrical Components, Devices, and Accessories: Listed and labeled as defined in NFPA 70, by a qualified testing agency, and marked for intended location and application.
- B. Comply with NECA 1.
- C. Comply with NFPA 70.
- D. Electronic data exchange between the video surveillance system and access-control system shall comply with SIA TVAC.

#### 1.4 WARRANTY

- A. Submit sample of manufacturer's warranty and documentation of final executed warranty completed in Owner's name and registered with manufacturer.
- B. Warranty Period: One year from date of completion for all Contractor provided parts and labor.

## **PART 2 - PRODUCTS**

### **2.1 SYSTEM REQUIREMENTS**

#### **A. Description:**

1. The Video Surveillance system for this project shall be an extension of the existing campus system with storage and licensing provided by Owner.
2. Camera system units shall be furnished by Owner and installed by Contractor.
3. Surge Protection:
  - a. Protect components from voltage surges originating external to equipment housing and entering through power, communication, signal, control, or sensing leads. Include surge protection for external wiring of each conductor's entry connection to components.
  - b. Minimum Protection for Communication, Signal, Control, and Low-Voltage Power Connections: Comply with requirements as recommended by manufacturer for type of line being protected.
4. Tamper Protection: Tamper switches on enclosures, control units, pull boxes, junction boxes, cabinets, and other system components shall initiate a tamper-alarm signal when unit is opened or partially disassembled. Control-station, control-unit alarm display shall identify tamper alarms and indicate locations.

### **2.2 NETWORK VIDEO RECORDERS**

- a. Exiting Genetec campus platform.

### **2.3 IP CAMERA SYSTEMS**

- A. Color Dome Camera: Assembled and tested as a manufactured unit, containing fixed color camera, varifocal lens, and vandal resistant dome assembly.
- B. Provide all wall and ceiling mounting hardware and brackets as indicated on drawing details. Coordinate color of mounting hardware with Owner and architect before installation.
- C. PTZ Camera: Assembled and tested as a manufactured unit, containing color camera, varifocal lens, vandal resistant dome assembly, Pan Tilt, Zoom capability and controls.
- D. Approved list of Camera Manufacturers:
  1. Axis or approved equal to be furnished by Owner and installed by Contractor.

### **2.4 POWER SUPPLIES**

- A. Low-voltage power supplies matched for voltage and current requirements of cameras and accessories, and of type as recommended by manufacturer of camera.
- B. Annunciation: Indicate change in system condition and switching of system or component to backup power.

### **PART 3 - EXECUTION**

#### **3.1 VIDEO SURVEILLANCE SYSTEM INSTALLATION**

- A. Install cameras so that each is level and plumb.
- B. Install cameras with 84-inch-minimum clear space below cameras and their mountings. Maximum outdoor camera height shall not exceed 13ft above ground. Change type of mounting to achieve required clearance. Keep camera views free from all obstructions.
- C. Install power supplies and other auxiliary components at control stations unless otherwise indicated.
- D. Install tamper switches on components indicated to receive tamper switches, arranged to detect unauthorized entry into system-component enclosures and mounted in self-protected, inconspicuous positions.
- E. Identify system components, wiring, cabling, and terminals according to Section "Identification for Electrical Systems."
- F. Miscellaneous hardware required for installation shall be suitable for the purpose for which it is used. Hardware includes nuts, bolts, screws, washers, miscellaneous fasteners, terminals, terminal strips, tie wraps, and related parts. Where the equipment manufacturer specifies hardware for use in the installation, the hardware specified shall be used. The finish on all hardware and fasteners shall be suitable for the environment in which it will be used and shall be selected to minimize corrosion or deterioration due to moisture, sunlight, or temperature extremes.
- G. All electrical power work and conduit work shall be by licensed electricians.
- H. The Security Systems Contractor will be required to install and test local equipment, programming it with an IP address specified by Owner. This support shall include the coordination of dates and times for programming and the testing of individual devices following programming. In all circumstances, the Security Systems Contractor's work shall not be considered complete until the equipment has been programmed and tested to the satisfaction of Owner.

#### **3.2 FIELD QUALITY CONTROL**

- A. Manufacturer's Field Service: Engage a factory-authorized service representative to inspect, test, and adjust components, assemblies, and equipment installations, including connections, and to assist in testing.
- B. Tests and Inspections:
  - 1. Inspection: Verify that units and controls are properly installed, connected, and labeled, and that interconnecting wires and terminals are identified.
  - 2. Pretesting: Align and adjust system and pretest components, wiring, and functions to verify that they comply with specified requirements. Conduct tests at varying lighting levels, including day and night scenes as applicable. Prepare video-surveillance equipment for acceptance and operational testing as follows:

- a. Prepare equipment list described in "Informational Submittals" Article.
    - b. Verify operation of auto-iris lenses.
    - c. Set back-focus of fixed focal length lenses. At focus set to infinity, simulate nighttime lighting conditions by using a dark glass filter of a density that produces a clear image. Adjust until image is in focus with and without the filter.
    - d. Set back-focus of zoom lenses. At focus set to infinity, simulate nighttime lighting conditions by using a dark glass filter of a density that produces a clear image. Additionally, set zoom to full wide angle and aim camera at an object 50 to 75 feet away. Adjust until image is in focus from full wide angle to full telephoto, with the filter in place.
    - e. Set and name all preset positions; consult Owner's personnel.
    - f. Set sensitivity of motion detection.
    - g. Connect and verify responses to alarms.
    - h. Verify operation of control-station equipment.
  3. Test Schedule: Schedule tests after pretesting has been successfully completed and system has been in normal functional operation for at least 14 days. Provide a minimum of 10 days' notice of test schedule.
  4. Operational Tests: Perform operational system tests to verify that system complies with Specifications. Include all modes of system operation. Test equipment for proper operation in all functional modes.
- C. Video surveillance system will be considered defective if it does not pass tests and inspections.
- D. Prepare and issue test and inspection reports.
- E. After work is completed, and prior to requesting the Final Acceptance Test, the Security Contractor shall conduct a final inspection and pre-test all equipment and system features. The Security Contractor shall correct any deficiencies discovered as the result of the inspection and pre-test.
- F. The Security Contractor shall notify Owner and Engineer to request a Final Acceptance Test. The request for Acceptance Test shall constitute a certification from the Security Contractor that:
1. All work is complete and in compliance with the Contract Documents.
  2. All systems have been tested.
  3. All corrections have been made.
- G. Technicians performing the acceptance test shall have been involved in the installation of the system and shall be thoroughly familiar with all aspects of the work.
- H. The Security Contractor shall provide all ladders, tools, test equipment as needed to accomplish the Final Acceptance Test.
- I. Any portions of the work found to be deficient or not in compliance with the Contract Documents will be rejected.

**3.3 ADJUSTING**

- A. Occupancy Adjustments: When requested within 12 months of date of Substantial Completion, provide on-site assistance in adjusting system to suit actual occupied conditions. Provide up to two visits to Project during other-than-normal occupancy hours for this purpose.

**3.4 DEMONSTRATION**

- A. Engage a factory-authorized service representative to train Owner's Security personnel to adjust, operate, and maintain video-surveillance equipment.
- B. Train Owner's maintenance personnel on equipment operation, startup and shutdown, troubleshooting, servicing, and preventative maintenance procedures. Review the data contained in the Operating and Maintenance Manuals with Owner's personnel. Training shall occur separate from startup activities. Provide 8 hours of training minimum.

**END OF SECTION 28 23 00**

## SECTION 283105 - FIRE ALARM CABLES AND PATHWAYS

### PART 1 - GENERAL

#### 1.1 RELATED DOCUMENTS

- A. Certain requirements common to all the mechanical and electrical trades (Fire Suppression, Plumbing, HVAC, Electrical, and Tele/Data) are specified in Division 20. To avoid repetition, they are not repeated in each relevant Division of the Specifications. However, these requirements are applicable to the work of this Division, and are hereby incorporated by reference.
- B. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.

#### 1.2 SUMMARY

- A. Section Includes:
  - 1. Fire alarm cables.
  - 2. Fire-resistive fire alarm cables.
  - 3. Fire-resistive data cables.
  - 4. Fiber-optic cables and hardware.
  - 5. Fire alarm terminal cabinets.
  - 6. Fire alarm raceway and boxes.

#### 1.3 DEFINITIONS

- A. Dedicated Continuous Metal Raceway: Enclosed metal pathway dedicated to power-limited fire alarm cable; comprised of and limited to: EMT, IMC, RGS, FMC, and / or LFMC as specified.

#### 1.4 ACTION SUBMITTALS

- A. Product Data: For each fire alarm cable application, including cable type, wire size, shielding, **circuit integrity**, and electrical characteristics.
  - 1. Include statement endorsed by the manufacturer's authorized representative that the electrical characteristics of the submitted fire alarm cables are within all operating parameters of the fire alarm system as designed and represented by the detailed fire alarm system Shop Drawings.
- B. Product Data: For fire alarm terminal cabinets, including furnished options and accessories.

#### 1.5 INFORMATIONAL SUBMITTALS

- A. Record of Inspection and Testing: For field wiring inspection and testing; for each circuit indicate measured values and corresponding acceptance criteria for circuit continuity, resistance, stray voltage, ground-faults, short-circuit-faults, and any other manufacturer recommended conductor field testing parameters.

1.6 QUALITY ASSURANCE

- A. Electrical Components, Devices, and Accessories: Listed and labeled as defined in NFPA 70, Article 100, by a testing agency acceptable to authorities having jurisdiction, and marked for intended use.

PART 2 - PRODUCTS

2.1 FIRE ALARM CABLES

- A. Manufacturers: Subject to compliance with requirements, provide products by one of the following:
  - 1. Belden Inc.
  - 2. Southwire Co.
  - 3. West Penn Wire.
  - 4. Windy City Wire.
  - 5. Or approved equal.
- B. Fire Alarm Cable: UL 1424, Type FPL, FPLR, and FPLP, power-limited fire alarm cable; red-jacketed, twisted-pair and parallel-pair insulated solid copper conductors; unshielded and shielded.
- C. Fire Alarm Water Resistant Cables: UL 444 & UL 13 and TIA455-82B Water Infiltration Test, power-limited fire alarm cable, twisted-pair insulated stranded copper conductors; unshielded and shielded.
- D. Fire Alarm Metal-clad Cable: UL 1424, Type MC-FPLP, power-limited fire alarm cable; jacketed, twisted-pair solid copper conductors with red aluminum interlocking outer armor jacket; unshielded and shielded.
  - 1. Basis-of-Design Product: Subject to compliance with requirements, provide Red Alert MC-FPLP cable, manufactured by Southwire Co.
- E. Minimum Fire Alarm Cable Conductor Size:
  - 1. Auxiliary (24 Vdc) Power: 14 AWG / 2C.
  - 2. Data Communications Network: 16 AWG / 2C.
  - 3. Digital Voice Riser: 16 AWG / 2C.
  - 4. Notification Appliance Circuits: 14 AWG / 2C.
  - 5. Relay Circuits: 14 AWG / 2C.
  - 6. RS Serial Data Communications: 18 AWG / 2C.
  - 7. Signaling Line Circuits: 16 AWG / 2C.
  - 8. Speaker Circuits: 16 AWG / 2C.
  - 9. Supervision Circuits: 16 AWG / 2C.
- F. Data and Voice Circuits:

1. Fire alarm cable for Data Communications Network, Digital Voice Riser, Signaling Line Circuits, Speaker Circuits, RS Serial Data Communications, and other manufacturer-specific data and voice circuits shall be shielded, twisted-pair unless fire alarm manufacturer's installation guidelines recommend or require unshielded twisted-pair cable.
2. Fire alarm cable electrical characteristics for Data Communications Network, Signaling Line Circuits, RS Serial Data Communications, and other manufacturer-specific data circuits shall comply with the fire alarm manufacturer limitations for linear-unit and total-circuit capacitance and resistance.

## 2.2 FIRE-RESISTIVE FIRE ALARM CABLES

- A. Multi-conductor Fire-resistive Cable: UL 2196 fire resistive, Type FPL, power-limited fire alarm cable; ceramifiable silicon insulation; jacketed, solid copper conductors; unshielded and shielded.
  1. Basis-of-Design Product: Subject to compliance with requirements, provide Duralife FPL fire resistive alarm cable, manufactured by Radix Wire Co.

## 2.3 FIRE-RESISTIVE DATA CABLES

- A. Multi-conductor Fire-resistive Cable: UL 2196 fire resistive, Type FPL, Category 3 channel, capable of transmitting signals at a speed of 10 Mbps, power-limited data cable; low smoke, zero halogen insulation; jacketed, solid copper conductors; unshielded and shielded.
  1. Basis-of-Design Product: Subject to compliance with requirements, provide FPL fire resistive data cable, manufactured by RATH Communications.

## 2.4 FIBER OPTIC CABLES FOR FIRE ALARM

- A. Manufacturers: Subject to compliance with requirements, provide products by one of the following:
  1. Belden Inc.
  2. CommScope, Inc.
  3. Corning Cable Systems.
  4. General Cable Technologies Corporation.
  5. Optical Cable Corporation.
  6. 3M Communication Markets Division.
  7. Tyco Electronics Corporation; AMP Products.
  8. Or approved equal.
- B. Description: Single-mode, 9/125-micrometer, 6-strand minimum, tight buffer, fiber optic cable; with performance characteristics to satisfy fire alarm system manufacturer requirements for digital network and voice applications.
  1. Multi-mode fiber permitted where required by fire alarm system manufacturer.
  2. Comply with ICEA S-83-596 for mechanical properties.
  3. Comply with TIA/EIA-568-B.3 for performance specifications.

4. Comply with TIA-492-CAAA for detailed specifications.
5. Maximum Attenuation (Premises): 1.0 dB/km at 1310 nm; 1.0 dB/km at 1550 nm.
6. Maximum Attenuation (Outside Plant): 0.5 dB/km at 1310 nm; 0.5 dB/km at 1550 nm.

C. Jacket:

1. Jacket Color: Yellow for 9/125-micrometer cable.
2. Cable cordage jacket, fiber, unit, and group color shall be according to TIA-598-C.
3. Imprinted with fiber count, fiber type, and aggregate length at regular intervals not to exceed 40 inches.

**2.5 OPTICAL FIBER CABLE HARDWARE**

A. Manufacturers: Subject to compliance with requirements, provide products by one of the following:

1. Belden Inc.
2. Corning Cable Systems.
3. Optical Cable Corporation.
4. 3M Communication Markets Division
5. Tyco Electronics Corporation; AMP Products.
6. Or approved equal.

B. Patch Panels: Modular panels housing multiple-numbered, duplex cable connectors.

1. Number of Connectors per Field: One for each cable of fibers assigned to field, plus spares and blank positions adequate to suit specified expansion criteria.

C. Patch Cords: Factory-made, dual-fiber cables in 36-inch lengths.

D. Cable Connecting Hardware:

1. Comply with Optical Fiber Connector Intermateability Standards (FOCIS) specifications of TIA-604-2-B, TIA-604-3-B, and TIA/EIA-604-12. Comply with TIA/EIA-568-B.3.
2. Quick-connect, simplex and duplex, Type SC or Type LC connectors. Insertion loss not more than 0.75 dB.
3. Type SFF connectors may be used in termination racks, patch panels, and equipment enclosures.

**2.6 FIRE ALARM TERMINAL CABINETS**

- A. Enclosure: 16-gauge steel; factory applied red enamel finish; removable hinged door with keyed locking latch; with embedded 1/2 inch, 3/4 inch, 1 inch, 1-1/2 inch and 2 inch knockout clusters.
- B. Terminals: Each terminal pole with quick-connect wire termination points and integral test port; sized to accept 20 - 12 AWG and rated for 20 amp at 250V (Class B/UL) 300V (CSA).
- C. Identification: Marked "FIRE ALARM TERMINAL CABINET" in 2-inch white factory applied indelible screened lettering; field identification labels on the inside cover corresponding to the terminal strip's labeling inside the back box.

- D. Basis-of-Design Product: Subject to compliance with requirements, provide IF-Series fire alarm terminal cabinets, manufactured by Space Age Electronics Inc.

## **2.7 FIRE ALARM RACEWAY AND BOXES**

- A. Comply with Division 26.
  - 1. Finish: Factory applied red finish for cover plates and connectors.

## **PART 3 - EXECUTION**

### **3.1 GENERAL**

- A. Comply with NFPA 70 and NFPA 72.
- B. Unless more restrictive requirements are noted in Division 28, comply with applicable Division 26 sections for the installation of low voltage electrical systems.
- C. Comply with Division for NFPA 72 pathway Class and Survivability Level requirements.
- D. Install fire alarm system pathways and cables in accordance with the reviewed fire alarm system Shop Drawings. Where field modifications of layout are necessary, obtain prior approval from the fire alarm system vendor's qualified fire alarm system designer.

### **3.2 FIRE ALARM PATHWAY INSTALLATION**

- A. Pathways for Fire Alarm: The pathway system for fire alarm shall be dedicated continuous metal raceway throughout.
  - 1. Comply with Division 26 for application and installation of EMT, IMC, RGS, FMC, and LFMC with respect to environmental conditions and resistance to physical damage.
  - 2. Plenum rated cable shall be permitted in place of Continuous Metal Raceway for the following applications:
- B. Pathways beneath Slab, Within Slab, and Buried: Comply with Division 26 for applicable RNC installation requirements.
- C. Class A and X Pathways: Unless greater distances are indicated on the Drawings or Specifications, install Class A and X pathways in compliance with NFPA 72 recommendations for minimum horizontal and vertical separation between supply and return pathways.

### **3.3 FIRE RESISTIVE PATHWAY INSTALLATION**

- A. Where NFPA 72 Survivability Level 2 or 3 pathways (2-hr fire resistance rated) are indicated or required, provide one of the following:
  - 1. UL 1424 fire alarm cable installed within 2-hr fire resistance rated shaft construction or similar 2-hr rated building construction.
  - 2. UL 2196 fire resistive fire alarm cable (Category FHJR) installed within metal raceway in accordance with the corresponding UL "Circuit Integrity System" (Category FHIT).
  - 3. UL 1424 fire alarm cable installed within metal raceway protected by an endothermic wrap assembly installed in accordance with the corresponding UL "Circuit Integrity System" (Category FHIT).

- a. Basis-of-Design Product: Interam Endothermic Mat, manufactured by 3M.

### 3.4 FIRE ALARM CABLE INSTALLATION

- A. Install fire alarm cables within dedicated continuous metal raceway throughout. Wiring shall be continuous between equipment, device, and appliance terminals without splices.
- B. T-tapping: Not permitted for any fire alarm circuit.
- C. Do not install fire alarm system wiring within conduits, junction boxes, or outlet boxes containing conductors of lighting or power systems.
- D. Separate power-limited and non-power-limited conductors within enclosures as recommended by the manufacturer. Install conductors parallel with or at right angles to sides and back of the enclosure. Bundle, lace, and train conductors to terminal points with no excess.
- E. Connect conductors that are terminated, spliced, or interrupted in any enclosure associated with the fire alarm system to terminal blocks. Mark each terminal according to the system's wiring diagrams.
- F. Not more than two conductors shall be installed under any device screw terminal. The wires under the screw terminal shall be straight when placed under the terminal then clamped in place under the screw terminal. The wires shall be broken and not twisted around the terminal.

### 3.5 FIBER OPTIC CABLE FOR FIRE ALARM INSTALLATION

- A. Comply with TIA/EIA-568-B.3.
- B. Cable may be terminated on connecting hardware that is rack or cabinet mounted.

### 3.6 GROUNDING

- A. Comply with Division 26.

### 3.7 FIELD QUALITY CONTROL

- A. Field inspections and testing shall be performed by fire alarm system manufacturer's factory-authorized service technicians.
- B. End-to-end cabling shall be considered defective if it does not pass tests and inspections.
- C. Perform visual wiring inspections in accordance with fire alarm system manufacturer recommendations. Correct deficiencies.
- D. Test wiring in accordance with fire alarm system manufacturer requirements and NFPA 72 for Initial Acceptance Testing of conductors. Correct deficiencies.
- E. Document inspections and tests via formal inspection test and report(s).

## **SECTION 283111 - DIGITAL, ADDRESSABLE FIRE ALARM SYSTEM**

### **PART 1 - GENERAL**

#### **1.1 RELATED DOCUMENTS**

- A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.

#### **1.2 SUMMARY**

- A. Section Includes:

1. Fire alarm control units.
2. Emergency voice messaging components.
3. Remote annunciators with microphone.
4. Power supplies.
5. Network communications.
6. Digital alarm communicator transmitters.
7. Internet protocol (IP) communicators.
8. Cellular communicators.
9. Digital alarm radio transmitters.
10. Municipal fire alarm boxes.
11. Manual fire alarm boxes.
12. System detectors.
13. Notification appliances.
14. Addressable interface modules.
15. Fault isolation modules.
16. Magnetic door holders.
17. Maintenance bypass switches.
18. System printers.
19. Emergency two-way communication systems.
20. Guards and shields.
21. Record document box.
22. Fire department key box.

#### **1.3 DEFINITIONS**

- A. ADS: Acoustically Distinguishable Space.

- B. AHJ: Authority Having Jurisdiction.
- C. BMS: Building Management System.
- D. EVACS: Emergency Voice Alarm Communication System.
- E. FACU: Fire Alarm Control Unit.
- F. FATC: Fire Alarm Terminal Cabinet.
- G. IDC: Initiating Device Circuit.
- H. NAC: Notification Appliance Circuit.
- I. NICET: National Institute for Certification in Engineering Technologies.
- J. PSTN: Publically Switched Telephone Network.
- K. SLC: Signaling Line Circuit.

#### 1.4 SUBMITTALS

- A. Comply with Division 20 for common mechanical/electrical requirements.
- B. Comply with Division 28 specifications and drawings; state/local regulations; and NFPA 72 - Chapter "Documentation". For purposes of applying NFPA 72, all identified documentation requirements are a mandatory part of the Work, including those that "apply only where required by other governing laws, codes, or standards, by other parts of the Code; or by project specifications or drawings".
- C. Submit Action Submittals prior to applying for authority having jurisdiction installation permits (where required) and system installation.
- D. Submit Informational Submittals after successful initial system testing and prior to scheduling authority having jurisdiction final approval demonstration testing.
- E. Submit Closeout Submittals as part of project closeout procedure.

#### 1.5 ACTION SUBMITTALS

- A. Product Data: For each type of product, including furnished options and accessories.
  - 1. Include approvals and listings, construction details, material descriptions, dimensions, profiles, and finishes.
  - 2. Include rated capacities, operating characteristics, and electrical characteristics.
  - 3. Include statement from manufacturer that all equipment and components have been tested as a system and meet all requirements of this Specification and of NFPA 72.
- B. Shop Drawings: For fire alarm system and fire safety control interfaces.
  - 1. Floor Plans. Include floor plans to indicate final equipment, cabinet, device and appliance locations. Indicate address of each addressable device. Show all interface modules. Show candela setting for each strobe appliance. Show complete point-to-point routing of all circuits and pathways; indicate Class and Survivability Level. Show size and type of all conduits, cable, wire, and conductors. Indicate panel circuit designation for each normal power supply branch circuit.
  - 2. Riser Diagram. Include complete device/appliance accurate riser diagram. Indicate address of each addressable device. Show all interface modules. Show candela setting of

each strobe appliance. Show each circuit and pathway; indicate Class and Survivability Level. Show size and type of all conduits, cable, wire, and conductors. Indicate panel circuit designation for each normal power supply branch circuit.

3. Equipment Wiring Diagrams. Include wiring diagrams for each system component/node including control unit cabinets, remote power supply cabinets, terminal cabinets, remote annunciators, supervising station transmitters, and PC workstations.
4. Component Wiring Diagrams. Include typical wiring diagrams for fire detector bases, pull stations, conventional devices, interface modules including wiring connections to supervised/controlled equipment, notification appliances, and component modules and cards.
5. Ductwork Smoke Detector Plans. Include installation details for typical ductwork detector condition. Show plan and section view for each condition. Show requirements for ductwork attachments, penetrations, and access panels.
6. Calculations - Voltage Drop. Include voltage drop calculations inclusive of safety/spare capacity factor(s) for notification-appliance circuits. Calculations shall assume alarm operation using the minimum standby power available at the conclusion of quiescent and alarm phases of operation.
7. Calculations - Power Supply and Battery Capacity. Include power capacity calculations inclusive of safety/spare capacity factor(s) for each system power supply and connected battery set.
8. Calculations - Conduit Fill. Include conduit fill calculations prepared in accordance with the National Electric Code.
9. Sequence of Operation. Include complete and detailed input/output sequence of operation matrix. Supplement matrix with narrative descriptions for complex specialty sequences.
10. Emergency Voice/Alarm Communication Systems; additionally:
  - a. Floor Plans. Indicate amplifier equipment cabinets, primary and remote paging locations, and associated circuits and pathways. Show wattage tap and corresponding ADS for each speaker. Indicate circuit pathway Class and Survivability Level.
  - b. Equipment Wiring Diagrams and Component Wiring Diagrams. For amplifier racks, remote microphone stations, and speaker appliances.
  - c. Amplifier Loading. For each speaker circuit, identify quantity of speakers at each wattage tap setting and total connected wattage per circuit and per amplifier. Demonstrate calculated loading inclusive of safety/spare capacity factor(s) is accommodated by amplifier nominal power (watts) capacity.
  - d. Audio dB Loss Calculations. For each speaker circuit.
  - e. Power Supply Battery Capacity Calculations. For each amplifier array power supply and connected battery set, inclusive of safety/spare capacity factor(s).

## 1.6 INFORMATIONAL SUBMITTALS

- A. Qualification Data: For qualified Installer and Certified Engineering Technician.

- B. Seismic Qualification Certificates: For fire alarm control unit, accessories, and components, from manufacturer.
  - 1. Basis for Certification: Indicate whether withstand certification is based on actual test of assembled components or on calculation.
  - 2. Dimensioned Outline Drawings of Equipment Unit: Identify center of gravity and locate and describe mounting and anchorage provisions.
  - 3. Detailed description of equipment anchorage devices on which the certification is based and their installation requirements.
- C. Record of Inspection and Testing. Detailed documentation of completed 100 percent fire alarm and signaling system initial acceptance testing. Use NFPA 72 "System Record of Inspection and Testing" forms.
- D. Statement of Completion: Written statement that system has been installed in accordance with approved plans and tested in accordance with the manufacturer's published instructions and appropriate NFPA 72 requirements.
- E. Sample Warranty: For special warranty.

#### 1.7 CLOSEOUT SUBMITTALS

- A. Record of Completion. Provide detailed description of installed, tested, and approved fire alarm and signaling system; including description of protected premises, fire alarm system and component sub-systems, fire safety function interfaces, monitoring service, and all other information required by NFPA 72. Use NFPA 72 "System Record of Completion" forms.
- B. Record Drawings. Provide complete Shop Drawing re-submittal updated to reflect actual final system installation and sequence of operation of all components.
- C. Device address list. Provide complete device address list organized by SLC loop and system node.
- D. System type detectors shall be tested for their sensitivity compensation head room range (% dirty). Detectors shall not be greater than 20% dirty for their compensation range. Detectors over 20% shall be clean or replaced per the manufacturer's requirements.
- E. Operation and Maintenance Data: For fire alarm systems and components to include in emergency, operation, and maintenance manuals.
  - 1. Provide manufacturer's Owner's Operation and Maintenance Manuals with required related system warranty requirements.
  - 2. Provide NFPA 72 "Inspection, Testing, and Maintenance" tables indicating required component inspection and testing activities and frequencies.
  - 3. Provide "Inspection and Testing Form" according to the "Inspection, Testing and Maintenance" chapter in NFPA 72, and include the following:
- F. Software and Firmware Operational Documentation:
  - 1. Provide software operating and upgrade manuals.
  - 2. Site-specific Software Backup: Provide on compact solid state USB storage device or compact disk; complete with data files.

**1.8 QUALITY ASSURANCE**

- A. **Installer Qualifications:** Personnel licensed by the governing licensing authority for the installation of fire alarm systems. Successfully installed, tested, obtained approvals for, and put into service no less than three (3) fire alarm systems similar in type, size, and complexity to that of the Work of this Section.
- B. **Certified Engineering Technician Qualifications:** Personnel trained and certified by the fire alarm system manufacturer as an approved technician.
  - 1. **Shop Drawings and Calculations** prepared by personnel certified by NICET as fire alarm Level III or IV technician, or licensed as a Professional Fire Protection Engineer by the governing licensing authority.
- C. **Source Limitations for Fire Alarm System and Components:** Single vendor source to provide fire alarm system components and connected non-system components as a single listed addressable fire alarm and signaling system.
  - 1. **Modifications to Existing Systems:** Components compatible with, and operate as an extension of, existing system.
- D. **Product Standards:** UL's "Fire Protection Equipment Directory" listing and "Approval Guide," published by FM Global.
  - 1. Subject to compliance with requirements, indication of a UL product requirement within Part 2 shall be construed to require a UL listed and FM approved product.
- E. **Electrical Components, Devices, and Accessories:** Listed and labeled as defined in NFPA 70, by a qualified testing agency, and marked for intended location and application.
  - 1. **Explosion-Proof:** Listed and labeled for use in "Hazardous (Classified) Locations"; Class and Division listing appropriate to intended location and application.

**1.9 COORDINATION**

- A. **Definition, "Coordinate":** Where Sections of the Work interact, the Contractor responsible for this Section of the Work initiates verbal and/ or written communication with one or more different Contractors responsible for other interacting Sections of the Work for the purposes of establishing a coordinated approach of product selections and installation sequencing that satisfies the individual requirements of the interacting Sections of the Work as well as the requirements of the Work as a whole.
- B. **Coordinate construction operations** with those of other Sections of the Work and other entities to ensure efficient and orderly installation of each part of the Work.
- C. **Coordinate operations and product selections** of this Section with operations and product selections included in different Sections that depend on each other for proper installation, connection, and operation.
- D. **Schedule construction operations** in sequence required to obtain the best results where installation of one part of the Work depends on installation of other components, before or after its own installation.
- E. **Coordinate installation** of different components with other Sections of the Work to ensure maximum performance and accessibility for required maintenance, service, and repair.
- F. **Make adequate provisions** to accommodate items scheduled for later installation.

- G. Coordination Drawings: Contribute to preparation of Coordination Drawings in the sequence established under Division 1 and Division 20; indicate water-based fire suppression system Work coordinated with other Sections of the Work.

#### 1.10 MAINTENANCE MATERIALS

- A. Furnish extra materials that match products installed and that are packaged with protective covering for storage and identified with labels describing contents.
  - 1. Smoke Detectors and Heat Detectors: Five (5) of each type installed.
  - 2. Detector Bases: Five (5) of each type installed.
  - 3. Audible and Visual Notification Appliances: Five (5) of each type installed.
  - 4. Keys and Tools: One extra set for access to locked or tamper-proof components.
  - 5. Fuses: Two (2) of each type installed in the system. Provide in a box or cabinet with compartments marked with fuse types and sizes.

#### 1.11 UNIT-COST ALLOWANCES

- A. Definition: Unit-cost allowance is a quantity of work established in lieu of additional requirements, used to defer the installation of materials and equipment to a later date when direction may be provided to Contractor by the Architect or Authorities Having Jurisdiction (AHJ) to provide labor and materials pursuant to final field coordination or AHJ final inspections.
- B. Unit-cost allowance shall include all necessary material, plus cost for delivery, installation, insurance, applicable taxes, overhead, and profit.
- C. Include the following Unit-cost Allowances:
  - 1. System spot-type smoke detector: Total quantity equal to five (5) installed.
  - 2. System spot-type heat detector: Total quantity equal to five (5) installed.
  - 3. System in-duct smoke detector: Total quantity equal to five (5) installed.
  - 4. System sampling tube duct smoke detector: Total quantity equal to five (5) installed.
  - 5. System carbon monoxide detector: Total quantity equal to five (5) installed.
  - 6. Monitor interface module: Total quantity equal to ten (10) installed.
  - 7. Relay / control interface module: Total quantity equal to ten (10) installed.
  - 8. Remote alarm indicator: Total quantity equal to five (5) installed.
  - 9. Audible / intelligible notification appliance: Total quantity equal to five (5) installed.
  - 10. Visible notification appliance: Total quantity equal to five (5) installed.
  - 11. Combination audible / intelligible and visible notification appliance: Total quantity equal to five (5) installed.
- D. Unused Materials: After installation has been completed and accepted by authorities having jurisdiction return unused materials to manufacturer or supplier and credit Owner for materials and labor.

1.12 WARRANTY

- A. Special Warranty: Manufacturer agrees to repair or replace fire alarm system equipment and components that fail in materials or workmanship within specified warranty period.
  - 1. Warranty Extent: All equipment and components not covered in the Maintenance Service Agreement.
  - 2. Warranty Period: One years from date of Substantial Completion.

PART 2 - PRODUCTS

2.1 MANUFACTURERS

- A. Subject to compliance with requirements, provide products listed as a component of a single addressable fire alarm and signaling system technology platform by one of the following:
  - 1. Simplex, (Johnson Controls).
    - a. System must conform to campus wide system manufacturer, no substitutions.
    - b. Existing system agency:
      - 1) Johnson Controls Fire Protection  
930 Riverview Dr. Suite 800  
Totowa NJ 07512
- B. Where additional manufacturer listings or basis of design products are indicated, provide products listed and duty-rated as compatible with the selected fire alarm and signaling technology platform.

2.2 SYSTEM DESCRIPTION

- A. UL 864; non-coded, microprocessor-based addressable protected premises fire alarm and signaling system, with multiplexed signal transmission and audible/visual evacuation signaling. All components provided listed for use and compatible with fire alarm system head-end FACU.
- B. Protected premises backbone architecture comprised of multiple fire alarm control units and system components networked via peer-to-peer communications node network.
- C. Control units, system components, and power supplies inclusive of boards, drivers, and expansion modules necessary to support the specified system performance criteria, minimum quantity of circuits, and NFPA 72 circuit pathway class designations.
- D. System circuiting and component power loading to provide minimum specified spare capacities, safety factors, and redundancies.
- E. Special Alarm Signal Processing – RESERVED.
- F. NFPA 72 Pathway Class (Performance During Fault) and Survivability Level (Fire Resistance):
  - 1. Addressable signaling loops.
    - a. Circuit Type: SLC.
    - b. Pathway Class: B.
    - c. Class A Short-circuit Fault Isolation Modules or Bases Located as Follows:

- 1) At each SLC exit/entry point of from/to a control unit or terminal cabinet.
  - 2) No more than twenty (20) addressable devices between isolation modules at any point on SLC.
- d. Pathway Survivability Level: 1.
2. Audible and intelligible public mode signaling (occupant evacuation).
  - a. Circuit Type: NAC.
  - b. Pathway Class: B.
  - c. Pathway Survivability Level: 1.
3. Visible public mode signaling (occupant evacuation).
  - a. Circuit Type: NAC.
  - b. Pathway Class: B.
  - c. Pathway Survivability Level: 1.
4. Audible and visible private mode signaling.
  - a. Circuit Type: NAC.
  - b. Pathway Class: B.
  - c. Pathway Survivability Level: 1.
5. Supervision of conventional devices.
  - a. Circuit Type: IDC.
  - b. Pathway Class: B.
  - c. Pathway Survivability Level: 1.
6. Fail-safe operation, magnetic door holders and similar.
  - a. Circuit Type: Fail safe.
  - b. Pathway Class: D.
  - c. Pathway Survivability Level: 1.
7. Partial evacuation or relocation EVACS; critical circuits that effect the operation of more than one (1) evacuation zone, and circuits located outside of the evacuation zone they serve.
  - a. Circuit Type: NAC, and SLC.
  - b. Pathway Class: A.
  - c. Pathway Survivability Level: 3.
- G. All addressable circuits designed and installed without T-taps.
- H. Maximum 100 addressable alarm-initiating devices on each SLC.
- I. No fewer than two (2) visible and two (2) audible NAC's serving each protected premises fire area or evacuation zone. Unless noted otherwise, notification appliances circuited such that no two adjacent appliances are connected to the same NAC.
- J. Component Primary Power: 24-V dc obtained from premises AC power supply.

1. Capacity: Alarm current draw of components connected to each power-supply module no greater than 80 percent of the power-supply module rating.
- K. Component Standby Power: 24-V dc supply system with batteries, automatic battery charger, and automatic transfer switch.
  1. Base Capacity: System operation for twenty-four (24) hours under quiescent load plus fifteen (15) minutes operating all alarm notification appliances.
  2. Spare Capacity: 20 percent.
- L. Remote power supplies used as distributed power sources only and not as in-line circuit power “boosters”.
- M. Fire alarm system listed for protected premises in-building Emergency Voice Alarm Communications System (EVACS) service utilizing digital multi-channel technology:
  1. Fire Emergency Voice Alarm Communications Systems (EVACS); comply with UL 864, 1480, and 1711.
  2. Amplifier loading no greater than 80 percent of rated power capacity (Watts).
  3. Complete functional integration (common audio circuits and speakers) of protected premises fire alarm in-building EVACS and premises Public Address System (PAS).
- N. Fire alarm system interfaces with other premises building systems including Fire Suppression, HVAC, Vertical Transportation, Audio/Visual, Public Address, Access Control, Fire Protection Opening Protectives, Emergency Power, and similar for all code-required and project-specified fire safety supervision and functional control.
- O. Fire alarm system control and supervision of building smoke control system(s) including automatic operation, manual operation, and indication of smoke control system component status. Comply with UL 864 UUKL.
- P. Dedicated manual and automatic initiating devices and notification appliances for indication of non-fire emergency conditions.
- Q. Retransmission of protected premises alarm, supervisory, and trouble status signals (Contact ID format) to an AHJ approved alarm supervising station.
- R. Wide-area Campus/Site Integration.
  1. Complete functional integration of protected premises in-building fire alarm network nodes with wide-area campus/site fire alarm node network to form a global peer-to-peer fire alarm network.
  2. Complete functional integration of protected premises in-building fire alarm network nodes with wide-area campus/site fire alarm node network via contact-id signal transmission to proprietary supervising station alarm receiver.
  3. Complete functional integration of protected premises in-building EVACS and campus/site Wide Area Mass Notification System (WAMNS).

## 2.3 PERFORMANCE REQUIREMENTS

- A. Operational Performance: Fire alarm system shall process alarm, supervisory, and trouble status signals and perform associated output functions in compliance with NFPA 72, Division 28 and Drawings “Input/Output Matrix”.

- B. Circuit Integrity and Fault Performance: Fire alarm system circuit integrity and functional performance capability under fault conditions shall comply with the NFPA 72 circuit Class designations as indicated within the "System Description" Article and as indicated on the Drawings.
- C. Survivability Performance: Fire alarm system fire resistive performance capability shall comply with the NFPA 72 circuit Level designations as indicated within the "System Description" Article and as indicated on the Drawings.
- D. Design and Installation Standard(s):
  - 1. Fire Alarm Systems: Comply with NFPA 72.
  - 2. FM Global: Comply with FM Global Datasheets for the design, installation, and testing of digital fire alarm systems.
- E. Seismic Performance: Fire alarm control unit and raceways shall withstand the effects of earthquake motions determined according to ASCE/SEI 7.
  - 1. The term "withstand" means "the unit will remain in place without separation of any parts from the device when subjected to the seismic forces specified and the unit will be fully operational after the seismic event."

#### 2.4 FIRE ALARM CONTROL UNITS

- A. General: UL 864; power-limited, field-programmable, microprocessor-based, modular design. Interconnected power supplies, circuit board modules, displays, and associated electronics mounted to standard mounting chassis within common control unit cabinet enclosure. Control unit cabinet assemblies configured as control units with integral display and controls or as transponder units with solid door and no local display/controls.
- B. Central Processors and System Software:
  - 1. Central Processing Unit (CPU): Solid-state processor for processing and storage of system status and event signal data and execution of control-by-event and logic software functions; with real-time clock for time annotation of events accurate to second time-increments.
  - 2. Memory: System software, event history logs, and programs held in nonvolatile flash, electrically erasable, programmable, read-only memory, retaining the information through failure of primary and secondary power supplies.
  - 3. Software Programming: Programmable via local FACU display and controls and also via externally connected laptop/PC programming application. Passwords required to access software program, one (1) "Master" password for highest level of permissions for use by authorized technicians and multiple "User" passwords for lower level permissions for use by general facilities personnel.
  - 4. Alarm Signal Processing:
    - a. General: General alarm actuation of notification appliances, emergency control function interface devices, and annunciation at the protected premises within 10 seconds of initiating device alarm activation.
    - b. Smoke Detector Verification: Capability to password-enable individual addressable smoke detectors to include a maximum 60 second verification phase.

- c. Pre-signal Alarm Sequence: Capability to password-enable system such that protected premises general alarm functions are delayed for more than 60 seconds after receipt of initial alarm signal; general alarm functions may be initiated automatically or by human action after delay.
  - d. Positive Alarm Sequence: Capability to password-enable system such that protected premises general alarm functions are delayed for no more than 15 seconds to permit manual acknowledgement of signal. If signal is not acknowledged within 15 seconds general alarm operation automatically initiates. If signal is acknowledged within 15 seconds, general alarm is delayed for up to 180 seconds to permit investigation. If fire alarm control unit is not reset within the investigation time-delay general alarm operation automatically initiates. If a second initiating device is activated during the investigation time-delay, general alarm operation automatically initiates.
- 5. Remote Smoke Detector Sensitivity Adjustment: Controls capable of selecting specific addressable smoke detectors for adjustment, display their current status and sensitivity settings, and change those settings. Allow controls to be used to program repetitive, time-scheduled, and automated changes in sensitivity of specific detector groups. Record sensitivity adjustments and sensitivity-adjustment schedule changes in system memory.
- 6. Software Zones: General alarm zone, releasing zone, and special logic zones used to map system inputs from assigned addressable device(s) to corresponding system output(s).
- 7. Time-Function Control: Capability to assign 24-hr clock time-dependent logic to event functions for time delay feature and/or automatic function scheduling to specific day of the week or year.
- 8. Non-Fire Events: Capability to assign "Non-Fire" ID category to module addresses such that assigned event functions are executed without indication at the FACU display.
- 9. Walk test: Test modes to permit system testing under bypass mode.
- C. Display and Controls:
  - 1. General: Display and controls arranged for interface between human operator and fire alarm system including system status indication, event status indication, manual query inputs, manual programming inputs, and manual output functions.
  - 2. Event Display: LCD; minimum 16 lines, 640 characters.
  - 3. Status Indicators: LED indicators for indication of system status; with corresponding membrane switch buttons to acknowledge incoming alarm, supervisory and trouble event signals.
  - 4. Audible Indicator: Piezo sounder for audible indication of system status and incoming event signals; silenced upon signal acknowledge.
  - 5. Keypad: Alpha-numeric entry and LCD navigation keys for display scrolling, item selection, system programming, and similar manual user operations.
  - 6. Function-key Modules: Membrane switch buttons used to initiate assigned software function, each with corresponding LED indicators for indication of function status.
- D. Signaling Line Circuit Controllers:
  - 1. SLC Loop Capacity: Minimum 125 addressable initiating devices and 125 addressable modules (250 addressable devices total) per loop.

2. Degrade Mode: Upon CPU communication failure, controllers capable of stand-alone function mode permitting alarm operation during communication fault condition.
3. Configuration: Capable of supporting Class A or Class B SLC configuration.
- E. Serial Interfaces: RS 232, RS 485 or equivalent for communication with system annunciators, printers, graphics displays, digital controllers, and similar distributed system components; USB ports for laptop configuration of system and file download to USB data storage devices.
- F. Cabinet Enclosures: Steel back-box with top, bottom, and side knockouts for 1/2-inch through 2-inch metal raceway; manufacturer's chassis rails for electronics mounting; key-lock latching, left or right swing hinged, removable steel front door panel with and without view panel(s); with trim accessories for flush mount where indicated in Part 3 "Equipment Installation" and Drawings; steel box and door surfaces in factory-finish red enamel.

## 2.5 EMERGENCY VOICE ALARM COMMUNICATION SYSTEMS

- A. General: NFPA 72 compliant, digital, multi-channel, one-way emergency voice alarm communication system for automatic and manual voice broadcast of fire or other emergency instructions and signals; distributed system architecture with central master audio controller and distributed amplifier arrays connected via digital voice audio riser.
- B. Master Audio Controller: Solid-state digital multi-channel audio controller with digitized alarm tones and digitally recorded voice messages stored in on-board memory.
- C. Tones and Messages: Selectable evacuation tones (Temporal-3, Slow/Fast Whoop, GSA), standard digitally pre-recorded voice messages and digitally recorded custom voice messages. Module on-board memory capacity sufficient for minimum of 32 minutes total message duration at standard resolution.
- D. Amplifiers: UL 1711, digital, multi-channel, power-limited 25 or 70 VRMS, with on-board test switches and indicators.
  1. Self-Backup Mode: Automatically re-route NAC's connected to a disabled amplifier channel to remaining active amplifier channel(s).
  2. Degrade Mode: On-board temporal pattern horn tone for default backup signaling over connected NAC's.
- E. Amplifier Supervision: Digital communication between amplifiers and controller for supervision and indication of amplifier status and operating power and voltage values.
- F. Microphone Module: Push-to-talk integral corded microphone for manual voice messaging; with local speaker, volume controls, and LED status indicators.
- G. Controls and Status Indicators:
  1. Indicators: LED indicators for indication of system status and operation of user selected functions.
  2. Function-keys: Membrane switch buttons with corresponding LED indicators for selective user initiation of voice messaging and evacuation functions on a premises-wide or per- zone basis.
- H. Auxiliary Audio Inputs: Audio controller capable of accepting line-level auxiliary audio source input for re-broadcast over emergency voice speaker circuits.

- I. Auxiliary Audio Outputs: Audio controller capable of transmitting line-level auxiliary audio source output for re-broadcast over another system's emergency or non-emergency voice speaker circuits.
- J. Cabinet Enclosures: Comply with Article "Fire Alarm Control Units" for cabinet enclosures. Modules and amplifiers mounted within cabinet enclosures common to FACU and within dedicated solid-door remote amplifier array cabinet enclosures.

## 2.6 REMOTE ANNUNCIATORS

- A. General: Display and controls remote from Fire Alarm Control Unit arranged for interface between human operator and fire alarm system including system status indication, event status indication, manual query inputs, manual programming inputs, and manual output functions.
- B. Event Display: LCD; minimum 2 lines, 40 characters.
- C. Status Indicators: LED indicators for indication of system status; with corresponding membrane switch buttons to acknowledge incoming alarm, supervisory and trouble event signals.
- D. Audible Indicator: Piezo sounder for audible indication of system status and incoming event signals; silenced upon signal acknowledge.
- E. Keypad: Alpha-numeric entry and LCD navigation keys for display scrolling, item selection, system programming, and similar manual user operations.
- F. Function-key Modules: A minimum of 8 membrane switch buttons used to initiate assigned software function, each with corresponding LED indicators for indication of function status.
- G. Enclosure: Comply with Article "Fire Alarm Control Units" for enclosures; steel box and door surfaces in factory-finish red enamel.

## 2.7 REMOTE ANNUNCIATORS WITH MICROPHONE

- A. General: Display and controls remote from Emergency Voice Messaging Control Unit arranged for interface between human operator and emergency voice system for manual voice messaging via push-to-talk microphone or selective keyed operation of emergency evacuation functions.
- B. Event Display: LCD; minimum 2 lines, 40 characters.
- C. Status Indicators: LED indicators for indication of system status; with corresponding membrane switch buttons to acknowledge incoming alarm, supervisory and trouble event signals.
- D. Audible Indicator: Piezo sounder for audible indication of system status and incoming event signals; silenced upon signal acknowledge.
- E. Keypad: Alpha-numeric entry and LCD navigation keys for display scrolling, item selection, system programming, and similar manual user operations.
- F. Function-keys: A minimum of 8 membrane switch buttons used to initiate assigned evacuation function, each with corresponding LED indicators for indication of function status.
- G. Enclosure: Comply with Article "Fire Alarm Control Units" for enclosures; steel box and door surfaces in factory-finish red enamel

## 2.8 POWER SUPPLIES

- A. General: Switched-mode supervised power supply base and expansion modules supplying regulated and filtered 24-V dc power to system components, notification appliances, and auxiliary power loads.
- B. FACU Applications: Power supply modules and batteries mounted within Fire Alarm Control Unit (FACU) equipment cabinets to provide integral system power to chassis-mounted components, connected notification appliance circuits, and connected auxiliary power circuits; batteries located within stand-alone battery cabinet for high-capacity applications.
- C. RPS Applications: Power supply modules and batteries mounted within distributed Remote Power Supply (RPS) equipment cabinets to provide supplemental power to connected notification appliance circuits and connected auxiliary power circuits.
- D. Primary Power Supply: 120-V ac.
- E. Secondary Power Supply: 24-V dc supply system including sealed lead acid batteries, automatic float-charge battery charger, and automatic transfer switch.
- F. Voltage Drop Calculations: Circuit loading no greater than 80 percent of rated nominal power voltage drop (Volts).
- G. Outputs: Programmable for operation as Notification Appliance or Auxiliary Power circuits; NAC outputs capable of operation as sync-generator or sync-follower; capable of supporting Class A or Class B circuit configuration.
- H. Supervision: Loss of primary power, low battery power, battery charger failure, and output circuit fault conditions supervised by fire alarm system via serial communication or system SLC supervision of trouble contacts.
- I. Cabinet Enclosures: Comply with Article "Fire Alarm Control Units" for cabinet enclosures.

## 2.9 NETWORK COMMUNICATIONS

- A. Provide network communications for fire-alarm system nodes and peripherals according to fire-alarm manufacturer's written requirements.

## 2.10 DIGITAL ALARM COMMUNICATION TRANSMITTERS

- A. Manufacturers: Subject to compliance with requirements, provide products by one of the following:
  - 1. Same manufacturer as the selected manufacturer of the fire alarm and signaling system technology platform.
  - 2. Simplex, (Johnson Controls)
  - 3. .
- B. General: UL 864 digital alarm communicator transmitter (DACT) compatible with supervising station receiving equipment; module mounted within FACU cabinet or within stand-alone enclosure; with onboard status LED indicators for component and signal transmission status.
- C. Signal Input Connections: Serial connection to host FACU.

- D. Signal Transmission Connections: Primary and secondary loop-start telephone lines; programmable such that both phone lines report to the same telephone number, or such that each phone line reports to a different telephone number.
- E. Transmission Format: Selectable for Contact ID, SIA, or 4/2 Pulse formats.
- F. Supervision: DACT system trouble status supervised by host FACU via serial interface or DACT auxiliary contacts.
- G. Self-Test: Conducted automatically every 24 hours with report transmitted to supervising stations.
- H. Programming: Remotely via serial interface or integral programming keypad with LED display.
- I. Power Supply: Primary 24-V dc obtained from premises AC power supply or host FACU power supply module. Standby 24-V dc supply system with batteries, automatic battery charger, and automatic transfer switch provided with DACT unit or as part of host FACU standby power supply system.

## 2.11 IP COMMUNICATORS

- A. Manufacturers: Subject to compliance with requirements, provide products by one of the following:
  - 1. Same manufacturer as the selected manufacturer of the fire alarm and signaling system technology platform.
  - 2. Simplex, (Johnson Controls)
- B. General: UL 864 IP communicator (native-IP module or IP-dialer-capture module) compatible with supervising station receiving equipment; module mounted within FACU cabinet or within stand-alone enclosure; with onboard status LED indicators for component and signal transmission status.
- C. Signal Input Connections: Serial connection to host FACU or telephone line connections to host FACU-DACT.
- D. Signal Transmission Connections: 10/100 Base network ethernet reporting to primary and secondary IP addresses; dynamic DCPH or static IP supported.
- E. Transmission Format: Selectable for Contact ID, SIA, or 4/2 Pulse formats converted to encrypted UDP protocol data transmission.
- F. Supervision: IP Communicator system trouble status supervised by host FACU via serial interface, FACU-DACT telephone line interface, or IP Communicator auxiliary contacts.
- G. Self-Test: Supervisory heartbeat signal of no less than once every 90 seconds to supervising station to ensure multiplexed level line supervision.
- H. Programming: Remotely via serial interface or integral programming keypad with LED display.

## 2.12 CELLULAR COMMUNICATORS

- A. Manufacturers: Subject to compliance with requirements, provide products by one of the following:

1. Same manufacturer as the selected manufacturer of the fire alarm and signaling system technology platform.
2. Simplex, (Johnson Controls)
- B. General: UL 864 cellular communicator compatible with supervising station receiving equipment; module mounted within stand-alone enclosure; with onboard status LED indicators for component and signal transmission status and remote antenna.
- C. Signal Input Connections: Serial connection to host FACU or telephone line connections to host FACU-DACT.
- D. Signal Transmission Connections: CDMA, GSM, or LTE cellular network pathway.
- E. Transmission Format: Selectable for Contact ID, SIA, or 4/2 Pulse formats converted to encrypted UDP protocol data transmission.
- F. Supervision: Cellular communicator system trouble status supervised by host FACU via serial interface, FACU-DACT telephone line interface, or communicator auxiliary contacts.
- G. Self-Test: Supervisory heartbeat signal of no less than once every 90 seconds to supervising station to ensure multiplexed level line supervision.
- H. Programming: Remotely via serial interface or integral programming keypad with LED display.
- I. Power Supply: Primary 24-V dc obtained from premises AC power supply or host FACU power supply module. Standby 24-V dc supply system with batteries, automatic battery charger, and automatic transfer switch provided with DACT unit or as part of host FACU standby power supply system.

#### 2.13 MUNICIPAL FIRE ALARM BOXES

- A. Manufacturers: Subject to compliance with requirements and municipality equipment standards, provide products by the following:
  1. Simplex, (Johnson Controls)
- B. Approved local energy-type, solid state, coded signal, master box for connection to municipal auxiliary fire alarm system; surface-mount for installation on pedestal.
- C. Operation methods:
  1. Integral manual pull.
  2. Alarm input signal from protected premises fire alarm system.
- D. Power supply: 24vdc from protected premises fire alarm system.
- E. Local supervision: Trouble conditions supervised by the protected premises fire alarm system.
- F. Enclosure: NEMA 4X steel enclosure, red finish, hinged door, lock assembly with keys; with 1/2-inch threaded conduit connections for installation of exterior flashing beacon.
- G. Pedestal Base: Subject to compliance with requirements and municipality equipment standards, provide Alloy Castings Co model ATC-1 pedestal with sub-base.
  1. Pedestal shall include factory fabricated custom mounting holes and conduit connections for installation of surface-mount electric waterflow bell.

**2.14 MANUAL FIRE ALARM BOXES**

- A. General: UL 38; die-cast metal housing, red finish, with molded, raised-letter operating instructions and “FIRE” identification in contrasting color; device shall show visible indication of operation.
- B. Double-action mechanism requiring two actions to initiate an alarm, pull-lever type; with integral or attached addressable module arranged to communicate manual-station status (normal, alarm, or trouble) to fire alarm control unit.
- C. Station Reset: Key- or wrench-operated switch.
- D. Indoor Protective Cover: Factory-fabricated, clear plastic enclosure hinged at the top to permit lifting for access to initiate an alarm. Lifting the cover actuates an integral battery-powered audible sounder intended to discourage false-alarm operation.
- E. Weatherproof Protective Cover: Factory-fabricated, clear plastic enclosure hinged at the top to permit lifting for access to initiate an alarm.

**2.15 SYSTEM FIRE DETECTORS**

- A. General: Analog addressable system smoke, system heat, or other system detectors for sensing products of combustion; listed as compatible with fire alarm system control unit and with integral addressable module capable of two-way analog communication with fire alarm control unit permitting remote sensitivity control, identification of device address, alarm status, trouble status, and trending of maintenance data.
- B. Detector Housing: Low profile, white-polycarbonate thermoplastic, impact resistant, and flame retardant detector housing for mounting into twist-lock base; with LED indicator for indication of detector status-polling (flashing) or in operation (constant).
- C. Detector Bases: Ceiling- and wall-mount, low profile, white-polycarbonate thermoplastic, impact resistant, and flame retardant plastic twist-lock fixed base; with terminals for SLC conductor terminations.
  - 1. Auxiliary Detector Bases: Optional bases furnished to perform supplemental detector-local functions.
    - a. Sounder bases to provide local audible alarm at detector; 24-V dc.
    - b. Relay bases for output control of associated equipment.
    - c. Isolation bases to isolate short circuit faults on SLC.
    - d. UL 2075 carbon monoxide sensor and associated distinct audible alarm and visual indicator.
- D. Remote Alarm Indicators (RAI): LED visual indicator in flush-mount plate, connected to corresponding detector base terminals for remote indication of detector alarm.
- E. Remote Test Station (RTS): RAI with key operated test switch for remote detector testing.
- F. Operating Voltage: 24-V dc nominal for detectors and auxiliary bases; 120-V ac rated contacts for relay bases as per application.
- G. Self-Restoring: Detectors do not require resetting or readjustment after actuation to restore them to normal operation.

**2.16 SYSTEM SMOKE DETECTORS**

- A. Comply with “System Fire Detectors” Article.
- B. UL 268, photoelectric spot-type with insect-screen protected sensing chamber; for installation in twist-lock system bases.
- C. Operating Temperature Range: 32 – 100 deg F (0 – 38deg C).
- D. Operating Humidity Range: 10 - 95 percent RH.
- E. Sensitivity Range: 1.5 - 5.0 percent obs/ft.
- F. Air Velocity Rating: 0 - 4,000 fpm (0 - 1220 mpm).

**2.17 SYSTEM IN-DUCT SMOKE DETECTORS**

- A. Comply with “System Fire Detectors” Article.
- B. UL 268A, photoelectric spot-type system smoke detector listed for installation directly within air distribution ductwork, with and without integral output relays.
- C. Mounting: For square and round ducts via factory furnished mounting kit or standard electrical raceway and boxes as per detector manufacturer requirements.
- D. Air Velocity Range: 0 - 4,000 fpm (0 - 1,220 mpm).

**2.18 SYSTEM SAMPLING TUBE DUCT SMOKE DETECTORS**

- A. Comply with “System Fire Detectors” Article.
- B. UL 268A, photoelectric spot-type system smoke detector listed for installation within detector housing mounted to exterior surface of air distribution ductwork, with connected sampling tubes transporting ductwork air to the external detector sensing chamber; with and without integral output relays.
- C. Mounting: For square and round ducts via factory furnished mounting kit.
- D. Air Velocity Range: 300 - 4,000 fpm (91 - 1,220 mpm).

**2.19 WEATHERPROOF ENCLOSURES**

- A. Basis of Design: Enviroarmour®, waterproof enclosure by Safety Technology International (STI)
- B. General: UL 50; NEMA-3R, 4 or 4x, non-metallic; lockable polycarbonate or fiberglass enclosure. Covers are lockable or screw-down door, A/C with heater option and dual thermostat.
- C. Operating Voltage: 120-V ac nominal for A/C with heater.

**2.20 SYSTEM HEAT DETECTORS**

- A. Comply with “System Fire Detectors” Article.
- B. UL 521, spot type heat detector actuated by either a fixed temperature of 135 deg F or a rate of rise that exceeds 15 deg F per minute unless other temperature rating(s) are indicated on Drawings.

**2.21 SYSTEM CARBON MONOXIDE DETECTORS**

- A. Comply with “System Fire Detectors” Article.
- B. UL 2075 carbon monoxide sensor integral to fire detector housing or as an auxiliary detector base; and permitting distinct addressable point identification of smoke alarm and/or carbon monoxide alarm at each detector. Audible and visible CO indicators distinct from smoke and heat detector indicators.

**2.22 NOTIFICATION APPLIANCES**

- A. Manufacturers: Subject to compliance with requirements, provide products by one of the following:
  - 1. Simplex, (Johnson Controls)
- B. General Performance Requirements for Notification Appliances: Signaling appliances connected to notification appliance circuits for NFPA 72 public operating mode signaling to building occupants protected by the fire alarm system; and private operating signaling to those persons directly concerned with implementation and direction of emergency action and procedures. Appliance assemblies include audible, audible/intelligible, visible, and combination type as indicated on Drawings.
- C. Mounting: Wall or ceiling mount as indicated on Drawings.
- D. Housing: Thermoplastic, impact resistant, and flame retardant.
- E. Finish: White housing with Red contrasting engraved lettering.
- F. Identification: Engraved lettering on housing indicating ”FIRE”.
- G. Weather proof applications: Listed for indoor and outdoor installation.

**2.23 AUDIBLE/INTELLIGIBLE NOTIFICATION APPLIANCES**

- A. Comply with “Notification Appliances” Article.
- B. Speakers: UL 1480, 25 or 70 nominal VRMS speaker within dedicated housing, listed sound pressure level of 90 dBA measured at 10 feet.
  - 1. Frequency Range: 400 to 4000 Hz.
  - 2. Wattage Taps: Field selectable 0.25 W, 0.50 W, 1.0 W, 2.0W.
- C. High-Range Audible and Intelligible Notification Appliances (Re-entrant Speakers):
  - 1. UL 1480, 25 or 70 nominal VRMS, listed sound pressure level of 102 dBA measured at 10 feet.
  - 2. Frequency Range: 400 to 14000 Hz.
  - 3. Wattage Taps: Field selectable 0.9, 1.8 W, 3.8 W, 7.5 W, 15.0 W.
  - 4. Finish: Red.

**2.24 VISIBLE NOTIFICATION APPLIANCES**

- A. Comply with “Notification Appliances” Article.

- B. Strobes: UL 1971, LED with clear polycarbonate lens mounted on an aluminum faceplate and field selectable candela output setting within dedicated housing, 24-V dc; with candela setting indicator visible through viewing window.
  - 1. Strobe flashing in temporal pattern, synchronized throughout each evacuation zone and synchronized between evacuation zones where strobes from multiple evacuation zones can be observed by a single viewer.
  - 2. Comply with Drawings for appliance candela output.
  - 3. Where existing circuiting have Xenon type, xenon type strobes are acceptable.
- C. Flashing Beacons: UL 1638; 6-inch diameter, red lens beacon, 24-V dc; listed for indoor and outdoor applications.

**2.25 COMBINATION AUDIBLE/INTELLIGIBLE AND VISIBLE NOTIFICATION APPLIANCES**

- A. Combination audible/intelligible and visible notification appliance with audible and visible signaling elements assembled within a common housing.
  - 1. Audible/intelligible speakers - comply with "Audible/Intelligible Notification Appliances" Article.
  - 2. Visible strobe - comply with "Visible Notification Appliances" Article.

**2.26 ADDRESSABLE INTERFACE MODULES**

- A. General: Microelectronic interface module for supervision and control of premises fire safety functions with integral address-setting means, internal code for FACU identification by module type, and output contact ratings to match controlled/supervised equipment.
- B. Monitor Module: Provides a system address for alarm-initiating devices for wired applications with normally open contacts.
- C. Relay Module: Capable of providing a direct output signal to controlled equipment or device.
  - 1. Allows the FACU to switch the relay contacts on command.
  - 2. Minimum of two normally open and two normally closed contacts available for field wiring.
- D. Control Module: Capable of providing a supervised direct output signal to controlled notification appliance, equipment or device.
  - 1. Allows the FACU to switch the relay contacts on command.
  - 2. Minimum of two normally open and two normally closed contacts available for field wiring.

**2.27 INTERPOSING RELAYS**

- A. Manufacturers: Subject to compliance with requirements, provide products by one of the following:
  - 1. Simplex, (Johnson Controls)
- B. Description: Multi-voltage relay for supervision and control of interface devices, with integral status indicator light.

1. Minimum of one Form-C contact, rated at 10-amps, energized by one of three input voltages: 24-VDC, 24-VAC, 120-VAC, 277-VAC or 480-VAC.

**2.28 FAULT ISOLATION MODULES**

- A. Module capable of sensing and automatically isolating SLC short circuit fault.

**2.29 MAGNETIC DOOR HOLDERS**

- A. Manufacturers: Subject to compliance with requirements, provide products by one of the following:
- B. Simplex, (Johnson Controls)Description: Normally powered hold opens, fail-closed; equipped for wall or floor mounting and complete with matching doorplate.
  1. Electromagnet: Requires no more than 3 W to develop 25-lbf holding force.
  2. Wall-Mounted Units: Flush mounted unless otherwise indicated.
  3. Operating Voltage: 120-V ac.
- C. Material and Finish: Match door hardware.

**2.30 MAINTENANCE BYPASS SWITCHES**

- A. Description: Keyed or push-button operated switches to open connected circuits that permit system testing without operating associated auxiliary fire safety functions. Activated switches shall annunciate as a trouble condition at the fire alarm control unit. Include trim plate with LED indicators factory-marked "NORMAL" and "DISABLE".

**2.31 SYSTEM PRINTERS**

- A. Printer shall be listed and labeled as an integral component of the fire alarm system.

**2.32 GUARDS AND SHIELDS**

- A. Description: Welded wire mesh of size and shape for the manual station, smoke detector, gong, or other device requiring protection.
  1. Factory fabricated and furnished by device manufacturer.
  2. Finish: Paint of color to match the protected device.

**2.33 RECORD DOCUMENT BOX**

- A. Enclosure: 18 gauge cold rolled steel with a red powder coat epoxy finish. The cover shall be permanently screened with 1" high lettering "FIRE ALARM DOCUMENTS" with indelible ink; removable hinged door with keyed locking latch.

**2.34 FIRE DEPARTMENT KEY BOX**

- A. Basis of Design: KnoxBox 3200®, by Knox Associates, Inc. (The Knox Company).
- B. General: UL 1037, UL 1610, UL 1332 and UL 437; surface or recessed mount with hinged door with tamper alert. Weather-resistance door gasket.

- C. Lock: Double-action rotating tumblers and hardened steel pins accessed by a biased cut key. Dust cover.
- D. Finish: Steel housing, black.
- E. NEMA-3R, 4 or 4x, non-metallic; lockable polycarbonate or fiberglass enclosure. Covers are lockable or screw-down door, A/C with heater option and dual thermostat.
- F. Operating Voltage: 120-V ac nominal for A/C with heater.

### **PART 3 - EXECUTION**

#### **3.1 PREPARATION**

- A. Prepare and submit “Action Submittals” prior to equipment procurement.

#### **3.2 TECHNICIAN DESIGN AND LAYOUT**

- A. Roles and responsibilities shall be as set forth in NSPE Position Statement No. 1749 “SFPE/NSPE/NICET Joint Position of the Engineer and the Engineering Technician Designing the Fire Protection System”, available at [nspe.org](http://nspe.org). As applied to the Work, the Contract Documents have been prepared by the “Engineer” and Shop Drawings required by this Section of the Work are prepared by the “Certified Engineering Technician”.
- B. As the Certified Engineering Technician, prepare Shop Drawings including drawings, calculations, certifications, and statements indicating system layout, circuiting, and capacities in accordance with the requirements of the Contract Documents.
- C. Design and Installation Standard(s): NFPA 70 and NFPA 72.
- D. Comply with the performance requirements indicated by the Contract Documents where such requirements are more stringent than those of the Design and Installation Standard(s); otherwise, comply with the performance requirements of the Design and Installation Standard(s).

#### **3.3 EXAMINATION**

- A. Examine areas and conditions for compliance with requirements for ventilation, temperature, humidity, and other conditions affecting performance of the Work.
  - 1. Verify that manufacturer's written instructions for environmental conditions have been permanently established in spaces where equipment and wiring are installed, before installation begins.
- B. Confirm fire resistance rating of building construction required to perform as fire alarm system Survivability protection before installation.
- C. Examine depth of stud walls to verify clearance for flush-mount equipment before installation.
- D. Examine roughing-in for electrical connections to verify actual locations of connections before installation.
- E. Examine proposed mounting locations of equipment cabinets with user displays and/or controls with the local fire official to verify satisfactory access and ease of identification before installation.

- F. Proceed with installation only after unsatisfactory conditions have been corrected.

### 3.4 EQUIPMENT INSTALLATION

- A. Comply with the most restrictive requirements of this Section and applicable Division 26 sections for the installation of low voltage electrical systems.
- B. Comply with NFPA 72, and requirements of authorities having jurisdiction for installation and testing of fire alarm equipment. Install all electrical wiring to comply with requirements in NFPA 70 including, but not limited to, Article 760, "Fire Alarm Systems."
- C. Install fire alarm system in accordance with the reviewed fire alarm system Shop Drawings. Where field modifications of layout are necessary, obtain prior approval from the fire alarm system vendor's qualified fire alarm system designer.
- D. Arrange equipment cabinets, wire-ways, and conduits with adequate clearances to facilitate access for inspection, maintenance, and component replacement.
- E. Install equipment cabinets with top and bottom of cabinets not more than 72 inches above finished floor and not less than 12 inches above finished floor, respectively.
- F. Install battery cabinets with top and bottom of cabinets not more than 48 inches above finished floor and not less than 12 inches above finished floor, respectively.
- G. Install fire alarm system modules and auxiliary components in accessible locations with bottom of modules and components not less than 12 inches
- H. Install equipment cabinets with user displays and/or controls including fire alarm control unit nodes and remote annunciators with displays and/or controls at natural user height.
- I. Flush-mount equipment cabinets/back-boxes not located in designated equipment rooms.
- J. Flush-mount wall- and ceiling-mounted initiating devices, modules, indicators, and notification appliances unless otherwise indicated.
- K. Surface-mount equipment cabinets/back-boxes located in designated equipment rooms.
- L. Surface-mount initiating devices, modules, indicators, and notification appliances installed on concrete or masonry unit walls.
- M. Surface-mount initiating devices installed to the underside of building structure.
- N. Surface-mount or pendant-mount notification appliances installed to the underside of structure.
- O. Install ceiling mounted devices, modules, indicators and notification appliances in alignment with adjacent ceiling fixtures and centered within ceiling tiles.
- P. Install wall mounted devices, modules, indicators and notification appliances in alignment with adjacent switches and wall fixtures.
- Q. Do not install addressable devices in areas subject to temperature extremes. Use conventional initiating devices supervised by addressable monitor modules remotely located within an adjacent conditioned space.

### 3.5 CABLE AND PATHWAY INSTALLATION

- A. Comply with Division 28.

**3.6 INSTALLATION FOR SURVIVABILITY**

- A. Where NFPA 72 Survivability Level 2 or 3 pathways are indicated or required, install fire alarm system cables and pathways within 2-hr fire resistance rated enclosures or comply with Division 28 for “Fire Resistive Pathway Installation”.
- B. Install control units, amplifiers, power supplies, junction boxes, terminal cabinets, or similar components within dedicated 2-hr fire resistance rated fire alarm system equipment rooms where the components originate or comprise a portion of a NFPA 72 Survivability Level 2 or 3 pathway.

**3.7 MANUAL FIRE ALARM BOX INSTALLATION**

- A. Install manual fire alarm boxes in the normal path of egress within 60 inches of the exit doorway.
- B. Install manual fire alarm boxes with operable handles between 42 inches and 48 inches above finish floor level.
- C. Install all manual fire alarm boxes at a common elevation with respect to finished floor.
- D. Install manual fire alarm boxes on a background of a contrasting color.
- E. Indoor Protective Covers: Provide covers for manual fire alarm boxes located in gym and pool areas.

**3.8 SYSTEM SPOT-TYPE FIRE DETECTOR INSTALLATION**

- A. Locate spot-type fire detectors in a manner that readily permits access – without the need of a lift - from the floor below for detector inspection, testing, and maintenance.
- B. Install fire detectors only after all dust and debris producing work is completed.
- C. Maintain factory provided detector covers on fire detectors until fire alarm system is approved for closeout and turnover.
- D. Install Remote Alarm Indicators in a visible location for each group of fire detector located within a normally locked room or area.
- E. Spot-type Smoke- and Heat-Detector Locations and Spacing:
  - 1. Comply with Drawings, and;
  - 2. Comply with NFPA 72 "Smoke-Sensing Fire Detectors".
  - 3. Comply with NFPA 72 "Heat-Sensing Fire Detectors".

**3.9 INSTALLATION OF AIR DISTRIBUTION DUCTWORK DETECTORS**

- A. Comply with NFPA 72, International Mechanical Code, and NFPA 90A.
- B. Install duct smoke detectors in accordance with manufacturer’s installation guidelines.
- C. Locate duct detectors in a manner that readily permits access for detector inspection, testing, and maintenance.
- D. Plan and coordinate duct detector locations and mounting requirements with Division 23 prior to ductwork fabrication and installation; show coordinated duct detector layout on Coordination Drawings and Shop Drawings.

- E. Furnish duct detector housings and ductwork attachments for installation under Division 23. Coordinate requirements for ductwork penetrations, attachments, sealant, and access panels with Division 23.
- F. Do not install duct detectors, housings, or sampling tubes in ductwork until all dust and debris producing work is complete and air distribution system cleaning and startup is complete. Duct detector housings may be attached to ductwork and connected to SLC/IDC prior to air distribution system startup provided they are protected from dust and debris using factory covers.
- G. Air Distribution Equipment Shutdown Applications: Use sampling-tube type system duct smoke detectors.
  - 1. Supply Air Systems: Locate duct smoke detectors downstream of fans and filters.
  - 2. Return Air Systems: Locate duct smoke detectors upstream of filters, exhaust air connections, outdoor air connections or decontamination equipment.
- H. Fire/Smoke Damper Control Applications: Where dampers are provided with conventional duct smoke detectors integral to the fire/smoke dampers (Division 23) supervise duct smoke detector alarm and trouble contacts via addressable interface modules.
- I. Fire/Smoke Damper Control Applications: Use in-duct (spot type) system smoke detectors that do not require a minimum air-stream velocity to operate or sampling-tube type system duct smoke detectors.
  - 1. Locate duct smoke detectors within 5 ft of the associated damper.
  - 2. Locate and support duct smoke detectors in accordance with manufacturer's installation guidelines.
- J. Applications for Detection of Carbon Monoxide within Air Distribution Ductwork: Locate carbon monoxide duct detectors within supply air ductwork served by fuel-fired air distribution equipment in accordance with applicable State or Municipal regulations.
- K. Install remote alarm test stations at each duct detector in readily accessible location that does not interfere with other sections of the Work.

### 3.10 NOTIFICATION APPLIANCE INSTALLATION

- A. Comply with Drawings and NFPA 72 "Notification Appliances".
- B. Wall-mounted Audible Notification Appliances: Install with top of appliance not less than 6 inches below the finished ceiling and not less than 90 inches below the finished floor.
- C. Wall-mounted Visible and -Combination Audible/Visible Notification Appliances: Install with top of appliance not less than 6 inches below the finished ceiling and the entire appliance strobe lens not less than 80 inches and not more than 96 inches above the finished floor.
- D. Install all wall-mounted notification appliances with top of appliance at a common elevation with respect to finished floor.
- E. Install exterior flashing beacons such that they are clearly visible from the primary fire department vehicle access route; and as indicated on Drawings. Use a dedicated NAC for each beacon.
- F. Install exterior alarm bells adjacent to each sprinkler fire department inlet connection; and as indicated on Drawings. Use a dedicated NAC for each bell.

3.11 CONNECTIONS AND INTERFACES

- A. Make connections to premises building systems and components via addressable interface modules. Include necessary interface modules, relays, wiring, resistors, and components as required to achieve the input/output sequence of operations performance criteria indicated by the Drawings.
- B. Coordinate voltage and current ratings of connected components such that connections and interfaces operate within listed limitations. Use interposing relays where connected loads exceed rating of addressable interface modules.
- C. Arrange connections and interfaces such that circuits are monitored for integrity as required by NFPA 72.
- D. Interface to premises systems and components requiring fire alarm supervision of status with addressable interface monitor modules.
- E. Interface to premises Preaction Sprinkler solenoids and/or Fire Extinguishing System actuators with addressable interface control modules listed for releasing service. Install a key operated maintenance disconnect switch in the releasing circuit to permit fire alarm system component testing without solenoid/actuator release. Operation of the maintenance disconnect switch be monitored by the fire alarm system as a supervisory condition.
- F. Interface to premises systems and components requiring Emergency Control Function Interface with addressable interface relay modules installed within 36 inches of the interface wiring termination point.
- G. Each addressable interface relay module used for Emergency Control Function Interface shall include one (1) set of spare contacts for monitoring connection to the premises Building Management System, Security System, or similar secondary premises system.
- H. For each HVAC air distribution unit, coordinate with Division 23 for exact interface requirements, quantity of fan drives, and detailed sequencing for proper shutdown of the associated air distribution equipment.
- I. Install maintenance bypass switches in output circuits for the following functions:
  - 1. Fire protection rated coiling door release.
  - 2. Building notification appliance circuits (audible and visual) - use maintenance switch with modules and necessary programming logic to achieve building wide supervised "silencing" during testing.
  - 3. Delayed Egress Doors.
  - 4. Security System Bypass.
  - 5. Audio/Visual System Bypass.
  - 6. Lighting Control Bypass.
  - 7. Elevator Recall Bypass.
  - 8. Air Handler Shutdown Bypass.
  - 9. Damper Bypass.
  - 10. Fire Suppression releasing modules (physical switch only permitted).
  - 11. Stair Pressurization.

3.12 IDENTIFICATION

- A. Identify system components, wiring, cabling, and terminals. Comply with Division 26.
- B. Label addressable initiating devices and bases and notification appliances. Comply with Drawings.
- C. Install framed instructions adjacent to the fire alarm control unit. Installed instructions shall be typewritten computer printout instruction card mounted behind a plastic or glass cover in a stainless-steel or aluminum frame. Include interpretation and describe appropriate response for displays and signals. Briefly describe the functional operation of the system under normal, alarm, and trouble conditions.

3.13 GROUNDING

- A. Comply with Division 26.
- B. Comply with fire alarm system manufacturer installation guidelines for grounding.
- C. Ground fire alarm control unit and associated circuits; comply with IEEE 1100. Install a ground wire from main service ground to fire alarm control unit

3.14 FIELD QUALITY CONTROL

- A. Devices installed but not yet placed in service shall be protected from construction dust, debris, dirt, moisture, and damage according to manufacturer's written storage instructions.
- B. Devices placed in service before all other trades have completed cleanup shall be replaced.
- C. Field inspections and testing shall be performed by fire alarm system manufacturer's factory-authorized service technicians.
- D. Smoke Control Systems: In addition to Div. 28 fire alarm system inspection and testing requirements, perform additional inspections and integrated functional testing as required to support smoke control system Special Inspections commissioning.
- E. Prepare a typewritten computer-output Test Plan that clearly establishes the scope of fire alarm and signaling system testing. Include at a minimum testing methods, personnel, duration, planned impairments, and required coordination for integrated testing of emergency control function interfaces.
- F. Functional field tests shall be witnessed by the Construction Manager (CM) and their designees; provide notifications a minimum of two (2) weeks in advance.
- G. Acceptance field testing shall be witnessed by the CM, their designees, and authorities having jurisdiction (AHJ); provide notifications a minimum of two (2) weeks in advance.
- H. Perform visual inspections in accordance with fire alarm system manufacturer recommendations and NFPA 72 for Initial Acceptance Inspections. Correct deficiencies.
- I. Document inspections by completing applicable sections of the NFPA 72 "System Record of Inspection and Testing" report.
- J. Provide written notifications for functional field tests; include Test Plan.
- K. Perform functional testing in accordance with fire alarm system manufacturer recommendations and NFPA 72 for "Initial Acceptance Testing". Correct deficiencies. Repeat

functional testing including retesting of unaffected components in accordance with NFPA 72 for “Reacceptance Testing”.

- L. System type detectors shall be tested for their sensitivity compensation head room range (% dirty). Detectors shall not be greater than 20% dirty for their compensation range. Detectors over 20% shall be clean or replaced per the manufacturer’s requirements.
- M. Document 100 percent satisfactory functional tests by completing remaining sections of the NFPA 72 “System Record of Inspection and Testing” report.
- N. Submit NFPA 72 “Statement of Completion” and completed NFPA 72 “System Record of Inspection and Testing” report.
- O. Provide written notifications for acceptance field tests; include Test Plan, NFPA 72 “Statement of Completion”, NFPA 72 “System Record of Inspection and Testing” report, and NFPA 72 “System Record of Completion”.
- P. Perform acceptance field testing. Demonstrate system operation to the satisfaction of the AHJ. Correct AHJ noted deficiencies. Repeat functional testing including retesting of unaffected components in accordance with NFPA 72 for “Reacceptance Testing”. Amend NFPA 72 “System Record of Inspection and Testing” report, and NFPA 72 “System Record of Completion”.
- Q. Place system into normal operating service without system faults or outstanding work.

### 3.15 MAINTENANCE SERVICE

- A. Initial Maintenance Service: Beginning at Substantial Completion, maintenance service shall include twelve (12) months' full maintenance by skilled employees of manufacturer's designated service organization. Include preventive maintenance, repair or replacement of worn or defective components, lubrication, cleaning, and adjusting as required for proper operation. Parts and supplies shall be manufacturer's authorized replacement parts and supplies.
  - 1. Perform visual inspections at intervals required by NFPA 72 Chapter “Inspection, Testing, and Maintenance”.
  - 2. Perform tests at intervals required by NFPA 72 Chapter “Inspection, Testing, and Maintenance”.

### 3.16 SOFTWARE SERVICE AGREEMENT

- A. Technical Support: Beginning with Substantial Completion, provide software support for two years.
- B. Upgrade Service: Update software to latest version at Project completion. Install and program software upgrades that become available within two years from date of Substantial Completion. Upgrading software shall include operating system. Upgrade shall include new or revised licenses for use of software.
  - 1. Provide 30 days' notice to Owner to allow scheduling and access to system and to allow Owner to upgrade computer equipment if necessary.

### 3.17 DEMONSTRATION

- A. Engage a factory-authorized service representative to train Owner's maintenance personnel to adjust, operate, and maintain fire alarm system.

H:\Y0586.00\DOC\SPEC\2025\_02-20\_IFB\283111\_DIGITAL ADDRESSABLE FIRE ALARM.DOC

## **SECTION 283133 - TWO WAY RADIO PES COMMUNICATIONS ENHANCEMENT SYSTEMS**

### **PART 1 - GENERAL**

#### **1.1 RELATED DOCUMENTS**

- A. Certain requirements common to all the mechanical and electrical trades (Fire Suppression, Plumbing, HVAC, Electrical, and Tele/Data) are specified in Division 20. To avoid repetition, they are not repeated in each relevant Division of the Specifications. However, these requirements are applicable to the work of this Division and are hereby incorporated by reference.
- B. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.

#### **1.2 SUMMARY**

- A. Section Includes:
  - 1. Bi-directional amplifiers.
  - 2. In-building service antennas.
  - 3. Outdoor donor antenna.
  - 4. Fire-resistive coaxial cabling.
  - 5. Fiber-optics cables and hardware.
  - 6. Coaxial cabling.
  - 7. Couplers and splitters.
  - 8. Remote indicator panels.

#### **1.3 DEFINITIONS**

- A. AHJ – Authority Having Jurisdiction.
- B. BDA – Bi-Directional Amplifier.
- C. FCC – Federal Communications Commission.
- D. ERRCS - Emergency Responder Radio Communications System.
- E. PES – Public Emergency Services.
- F. RF – Radio frequency.
- G. TRCES – Two-Way Radio Communications Enhancement System.

#### **1.4 SUBMITTALS**

- A. Comply with Division 20 for common mechanical/electrical requirements.
- B. Comply with Division 28 specifications and drawings; state/local regulations, NFPA 72, and NFPA 1221.

- C. Submit Action Submittals prior to applying for authority having jurisdiction installation permits (where required) and system installation.
- D. Submit Informational Submittals after successful initial system testing and prior to scheduling authority having jurisdiction final approval demonstration testing.
- E. Submit Closeout Submittals as part of project closeout procedure.

#### 1.5 ACTION SUBMITTALS

- A. Product Data: For each type of product, including furnished options and accessories.
  - 1. Include approvals and listings, construction details, material descriptions, dimensions, profiles, and finishes.
  - 2. Include rated capacities, operating characteristics, and electrical characteristics.
  - 3. Include statement from TRCES vendor that all equipment and components are compatible and represent a complete TRCES meeting all requirements of the AHJ, FCC, NFPA 72, NFPA 1221, and this Specification.
- B. Software-simulated radio propagation modeling summary including with heat maps showing predicted signal coverage levels within the building.
- C. Shop Drawings: For TRCES.
  - 1. Floor Plans. Include floor plans to indicate final equipment, amplifier, power supplies, alarm panels, antennas, and cabling. Show complete point-to-point routing of all cable and pathways; indicate Class and Survivability Level. Show size and type of all conduits, cable, wire, and conductors. Indicate panel circuit designation for each normal power supply branch circuit.
  - 2. Location Map. Include location map showing project site location, RF signal donor site location, and the distance between the two locations.
  - 3. Riser Diagram. Include complete component accurate riser diagram; indicate equipment, amplifiers, power supplies, alarm panels, antennas, and cabling. Show each circuit and pathway; indicate Class and Survivability Level. Show size and type of all conduits, cable, splitters, couplers, wire, and conductors. Indicate panel circuit designation for each normal power supply branch circuit.
  - 4. Equipment Wiring Diagrams. Include wiring diagrams for each system component including amplifiers, power supplies, alarm panels, and antennas.
  - 5. Calculations - Power Supply and Battery Capacity. Include power capacity calculations inclusive of safety/spare capacity factor(s) for each system power supply and connected battery set.
  - 6. Sequence of Operation. Include complete and detailed input/output sequence of operation narrative description.

#### 1.6 INFORMATIONAL SUBMITTALS

- A. Qualification Data: For Designers and Field Technicians.
- B. Seismic Qualification Certificates: For fire alarm control unit, accessories, and components, from manufacturer.

1. Basis for Certification: Indicate whether withstand certification is based on actual test of assembled components or on calculation.
  2. Dimensioned Outline Drawings of Equipment Unit: Identify center of gravity and locate and describe mounting and anchorage provisions.
  3. Detailed description of equipment anchorage devices on which the certification is based and their installation requirements.
- C. Baseline Radio Signal Strength Testing Report: Detailed report indicating NFPA 72/1221 plotted interior RF signal strength and/or delivered audio quality (DAQ) score throughout building critical and general areas with all interior partitions constructed and doors installed, without TRCES installed. Format shall be approved by the AHJ.
- D. Statement of Completion: Written statement that system has been installed in accordance with approved plans and tested in accordance with the manufacturer's published instructions and appropriate NFPA 72/1221 requirements.
- E. Record of Inspection and Testing. Detailed documentation of completed TRCES acceptance testing. Format shall be approved by the AHJ.
- F. Sample Warranty: For special warranty.

#### 1.7 CLOSEOUT SUBMITTALS

- A. Record Drawings. Provide complete Shop Drawing re-submittal updated to reflect actual final system installation and sequence of operation of all components.
- B. Operation and Maintenance Data: For TRCES to include in emergency, operation, and maintenance manuals.
1. Provide manufacturer's Owner's Operation and Maintenance Manuals with required related system warranty requirements.
  2. Provide Record of Inspection and Testing.

#### 1.8 QUALITY ASSURANCE

- A. Designer and Field Technician Qualifications: Personnel trained and certified by the TRCES manufacturer as an approved technician; and as required by the AHJ, in possession of a professional engineering license, radio licensing authority license, and/or industry certification.
- B. Source Limitations for TRCES: Single vendor source to provide TRCES components as a complete code-compliant, tested and functioning TRCES.
- C. Electrical Components, Devices, and Accessories: Approved by the AHJ and listed and labeled as defined in NFPA 70, by a qualified testing agency, and marked for intended location and application.
1. Specific Agency Requirements for All Products: RF emitting devices certified by the Radio Licensing Authority.

#### 1.9 COORDINATION

- A. Definition, "Coordinate": Where Sections of the Work interact, the Contractor responsible for this Section of the Work initiates verbal and/ or written communication with one or more different Contractors responsible for other interacting Sections of the Work for the purposes of

establishing a coordinated approach of product selections and installation sequencing that satisfies the individual requirements of the interacting Sections of the Work as well as the requirements of the Work as a whole.

- B. Coordinate construction operations with those of other Sections of the Work and other entities to ensure efficient and orderly installation of each part of the Work.
- C. Coordinate operations and product selections of this Section with operations and product selections included in different Sections that depend on each other for proper installation, connection, and operation.
- D. Schedule construction operations in sequence required to obtain the best results where installation of one part of the Work depends on installation of other components, before or after its own installation.
- E. Coordinate installation of different components with other Sections of the Work to ensure maximum performance and accessibility for required maintenance, service, and repair.
- F. Make adequate provisions to accommodate items scheduled for later installation.
- G. Coordination Drawings: Contribute to preparation of Coordination Drawings in the sequence established under Division 1 and Division 20; indicate water-based fire suppression system Work coordinated with other Sections of the Work.

#### 1.10 WARRANTY

- A. Special Warranty: Manufacturer agrees to repair or replace system equipment and components that fail in materials or workmanship within specified warranty period.
  - 1. Warranty Extent: All equipment and components not covered in the Maintenance Service Agreement.
  - 2. Warranty Period: **Five (5)** years from date of Substantial Completion.

#### 1.11 SPECIAL SEQUENCE AND SCHEDULING

- A. Sequence and schedule TRCES design, submittal activities, installation, and approvals to allow for Baseline Testing prior to TRCES installation.
- B. TRCES installation shall be pre-planned and space for components and pathways necessary for full system installation reserved.
- C. Unless otherwise noted, proceed with TRCES component installation only after the need for radio signal enhancement is supported by Baseline Radio Signal Strength Testing.
  - 1. Install cabling system sections scheduled to be concealed within wall construction or similar in normal rough-in construction sequence.
- D. Perform Baseline Radio Signal Strength Testing upon substantial completion of building exterior façade and interior wall partitions including door installation.
  - 1. Baseline testing shall be performed by personnel in possession of a radio licensing authority license, and/or industry certification as required by the AHJ.
  - 2. Provide written notifications for baseline tests.
  - 3. Baseline tests shall be witnessed by the Construction Manager (CM) and their designees; provide notifications a minimum of two (2) weeks in advance.

4. Perform baseline testing in accordance with NFPA 72/1221 and AHJ requirements for plotted interior building RF signal strength and/or delivered audio quality (DAQ) score.
5. Document baseline tests via AHJ approved report format.
- E. Where Baseline Radio Signal Strength Testing demonstrates that minimum required radio signal strength values are provided within building areas as required by the AHJ without the use of a TCRES, obtain approval from the AHJ to omit the TCRES installation from the Work within those building areas.
  1. All TCRES component and pathway space requirements shall remain reserved for such use to permit future TCRES installation should delivered radio signal strength to the building site decrease during the lifetime of the building.
- F. Where Baseline Radio Signal Strength Testing demonstrates the need for a TCRES, proceed with installation. Incorporate the results of the Baseline testing into the design layout for in-building service antenna locations.

## PART 2 - PRODUCTS

### 2.1 SYSTEM DESCRIPTION

- A. UL 2524 and FCC certified Two-Way Radio Communications Enhancement System (TRCES) inclusive of Bi-Directional Amplifier(s) (BDA), transmission lines, cables, power supplies, antennas and other ancillary equipment that allows radio signals to pass to and from the interior of a structure for the purpose of facilitating radio communications using public emergency services (PES) radio frequencies.
- B. System components, and power supplies inclusive of boards and expansion modules necessary to support the specified system performance criteria, minimum quantity of circuits, and NFPA 72/1221 circuit pathway class designations.
- C. System circuiting and component power loading to provide minimum specified spare capacities, safety factors, and redundancies.
- D. NFPA 72/1221 Pathway Survivability Level (Fire Resistance):
  1. Riser coaxial cables: Level 2 or 3.
  2. Feeder coaxial cables: Level 0.
- E. Component Primary Power: 24-V dc obtained from premises AC power supply.
  1. Capacity: Component current draw of components connected to each power-supply module no greater than 80 percent of the power-supply module rating.
- F. Component Standby Power: 24-V dc supply system with batteries, automatic battery charger, and automatic transfer switch.
  1. Base Capacity: System operation for **24** hours.
  2. Spare Capacity: 20 percent.
- G. TRCES status signals displayed at a dedicated TRCES Remote Indicator Panel.
- H. TRCES status signals supervised by the protected premises Fire Alarm System.

## 2.2 PERFORMANCE REQUIREMENTS

- A. Operational Performance: TRCES shall provide no less than minimum downlink and uplink radio signal strength coverage in all critical and general building areas as required by the AHJ. TRCES shall be capable of transmitting all radio frequencies assigned to the jurisdiction as required by the AHJ. TRCES shall be capable of using any modulation technology in current use by the public safety agencies in the jurisdiction as required by the AHJ.
- B. Survivability Performance: TRCES fire resistive performance capability shall comply with the NFPA 72/1221 circuit Level designations as indicated within the "System Description" Article and as indicated on the Drawings.
- C. Seismic Performance: Fire alarm control unit and raceways shall withstand the effects of earthquake motions determined according to ASCE/SEI 7.
  - 1. The term "withstand" means "the unit will remain in place without separation of any parts from the device when subjected to the seismic forces specified and the unit will be fully operational after the seismic event."
- D. Baseline Radio Signal Strength Testing: Where baseline testing demonstrates that minimum required radio signal strength values are provided within building areas as required by the AHJ without the use of a TCRES, obtain approval from the AHJ to omit the TCRES installation from the Work in those areas.

## 2.3 BI-DIRECTIONAL AMPLIFIERS

- A. Manufacturers: Subject to compliance with requirements, provide products by one of the following:
  - 1. Advanced RF Technologies, Inc.
  - 2. Bird Technologies.
  - 3. Comprod.
  - 4. Comba Telecom, Inc.
  - 5. Radio Solutions, Inc.
  - 6. Or approved equal.
- B. General: RF signal booster suitable for public safety emergency responder communications; field-programmable gain adjustment; microprocessor-based control system for monitoring voltage, current, temperature, and output level control status; with panel-mounted backlit LCD display, controls, and LED indicators for indication of system status.
- C. Primary Power Supply: 120-V ac.
- D. Secondary Power Supply: 24-V dc supply system including sealed lead acid batteries, automatic float-charge battery charger, and automatic transfer switch.
- E. Supervision: Auxiliary contacts for remote status supervision of signal booster failure, antenna malfunction, loss of primary power, low battery voltage, battery charger failure at a minimum; additionally any other system status supervision required by the AHJ.
- F. Cabinet Enclosures: For amplifiers, power supplies, and other system components. NEMA 4 steel back-box with top, bottom, and side knockouts metal raceway;; key-lock latching, left or right swing hinged, removable steel front door panel; with trim accessories for flush mount

where indicated in Part 3 “Equipment Installation” and Drawings; steel box and door surfaces in factory-finish red enamel.

## **2.4 IN-BUILDING SERVICE ANTENNAS**

- A. Manufacturers: Subject to compliance with requirements, provide products by one of the following:
  - 1. Comprod.
  - 2. Fractal Antenna Systems, Inc.
  - 3. Laird Technologies, Inc.
  - 4. PCTEL Antenna Products Group, Inc.
  - 5. Or approved equal.
- B. General: Wideband omnidirectional, multi-band type; low-profile ceiling-mount, white finish.
  - 1. Single-band permitted if multi-band is not required within the applicable jurisdiction and approved by the AHJ.
- C. Plenum Application Fire Test Listing: UL 2043.
  - 1. Manufacturer’s standard flame retardant/flame resistant product option permitted for non-plenum applications.

## **2.5 OUTDOOR DONOR ANTENNA**

- A. Manufacturers: Subject to compliance with requirements, provide products by one of the following:
  - 1. Comprod.
  - 2. Laird Technologies, Inc.
  - 3. PCTEL Antenna Products Group, Inc.
  - 4. Or approved equal.
- B. General: Factory assembled and tuned directional UHF Yagi antenna; welded or seamless corrosion resistant aluminum construction; DC grounded; with stainless steel mounting hardware.
- C. Wind Velocity Withstand Rating: Comply with minimum Building Code wind load requirements for building appurtenances.

## **2.6 FIRE-RESISTIVE COAXIAL CABLING**

- A. Basis-of-Design Product: Subject to compliance with requirements, provide DragonSkin Coaxial Cable, manufactured by Radio Frequency Systems.
  - 1. UL 2196, UL System FHIT 1250, 2-hour rated circuit integrity coaxial cable.
  - 2. Pathway Survivability Level: 2 or 3.

**2.7 FIBER OPTIC CABLES FOR EMERGENCY RESPONDER RADIO COMMUNICATIONS SYSTEM**

- A. Manufacturers: Subject to compliance with requirements, provide products by one of the following:
1. Belden Inc.
  2. CommScope, Inc.
  3. Corning Cable Systems.
  4. General Cable Technologies Corporation.
  5. Optical Cable Corporation.
  6. 3M Communication Markets Division.
  7. Tyco Electronics Corporation; AMP Products.
  8. Or approved equal.
- B. Description: Single-mode, 9/125-micrometer, 6-strand minimum, tight buffer, fiber optic cable; with performance characteristics to satisfy fire alarm system manufacturer requirements for digital network and voice applications.
1. Multi-mode fiber permitted where required by fire alarm system manufacturer.
  2. Comply with ICEA S-83-596 for mechanical properties.
  3. Comply with TIA/EIA-568-B.3 for performance specifications.
  4. Comply with TIA-492-CAAA for detailed specifications.
  5. Maximum Attenuation (Premises): 1.0 dB/km at 1310 nm; 1.0 dB/km at 1550 nm.
  6. Maximum Attenuation (Outside Plant): 0.5 dB/km at 1310 nm; 0.5 dB/km at 1550 nm.
- C. Jacket:
1. Jacket Color: Yellow for 9/125-micrometer cable.
  2. Cable cordage jacket, fiber, unit, and group color shall be according to TIA-598-C.
  3. Imprinted with fiber count, fiber type, and aggregate length at regular intervals not to exceed 40 inches.

**2.8 OPTICAL FIBER CABLE HARDWARE**

- A. Manufacturers: Subject to compliance with requirements, provide products by one of the following:
1. Belden Inc.
  2. Corning Cable Systems.
  3. Optical Cable Corporation.
  4. 3M Communication Markets Division
  5. Tyco Electronics Corporation; AMP Products.
  6. Or approved equal.

- B. Patch Panels: Modular panels housing multiple-numbered, duplex cable connectors.
  - 1. Number of Connectors per Field: One for each cable of fibers assigned to field, plus
  - 2. spares and blank positions adequate to suit specified expansion criteria.
- C. Patch Cords: Factory-made, dual-fiber cables in 36-inch lengths.
- D. Cable Connecting Hardware:
  - 1. Comply with Optical Fiber Connector Intermateability Standards (FOCIS) specifications of TIA-604-2-B, TIA-604-3-B, and TIA/EIA-604-12. Comply with TIA/EIA-568-B.3.
  - 2. Quick-connect, simplex and duplex, Type SC or Type LC connectors. Insertion loss not more than 0.75 dB.
  - 3. Type SFF connectors may be used in termination racks, patch panels, and equipment enclosures.

## 2.9 COAXIAL CABLING

- A. Manufacturers: Subject to compliance with requirements, provide products by one of the following:
  - 1. CommScope, Inc.
  - 2. Trilogy Communications, Inc.
  - 3. West Penn Wire.
  - 4. Or approved equal.
- B. Riser Coaxial Cable: Nominal 0.5-inch, 50 Ohm coaxial cable, with corrugated copper or aluminum outer conductor and UL 1666 CATVR jacket.
- C. Plenum Coaxial Cable: Nominal 0.5-inch, 50 Ohm coaxial cable, with corrugated copper or aluminum outer conductor and UL 910 CATVP jacket.
- D. Plenum Radiating Coaxial Cable: Nominal 0.5-inch, 50 Ohm radiating coaxial cable, with corrugated copper or aluminum outer conductor and UL 910 CATVP jacket.
- E. Connectors: Nominal 0.5-inch, 50 Ohm N-type coaxial cable connectors.

## 2.10 COUPLERS AND SPLITTERS

- A. Manufacturers: Subject to compliance with requirements, provide products by one of the following:
  - 1. Cobham Wireless.
  - 2. CommScope, Inc.
  - 3. Scientific Components Corp as Mini Circuits.
  - 4. Or approved equal.
- B. General: 50 Ohm RF couplers and splitters; bandwidth and dB rating as required by TRCES performance requirements; NEMA 4/IP65 enclosure with nominal 0.5-inch N-type coaxial cable connectors.

**2.11 REMOTE INDICATOR PANELS**

- A. General: Zone indicator panel constructed of 16-gauge steel with factory applied red enamel finish; with LED indicators and corresponding factory-screened labels; includes piezo sounder and switches for lamp test and alarm silence.
- B. LED Indicators: Green indicator for primary power in normal state; Red indicators for each individual fault status required to be indicated by the AHJ.

**PART 3 - EXECUTION**

**3.1 PREPARATION**

- A. Prepare and submit "Pre-Installation Submittals" prior to equipment procurement.

**3.2 EXAMINATION**

- A. Examine areas and conditions for compliance with requirements for ventilation, temperature, humidity, and other conditions affecting performance of the Work.
  - 1. Verify that manufacturer's written instructions for environmental conditions have been permanently established in spaces where equipment and wiring are installed, before installation begins.
- B. Confirm fire resistance rating of building construction required to perform as TRCES Survivability protection before installation.
- C. Examine depth of stud walls to verify clearance for flush-mount equipment before installation.
- D. Examine roughing-in for electrical connections to verify actual locations of connections before installation.
- E. Examine proposed mounting locations of equipment cabinets with user displays and/or controls with the local fire official to verify satisfactory access and ease of identification before installation.
- F. Proceed with installation only after unsatisfactory conditions have been corrected.

**3.3 EQUIPMENT INSTALLATION**

- A. Comply with the most restrictive requirements of this Section and applicable Division 26 sections for the installation of low voltage electrical systems.
- B. Comply with NFPA 72/1221, and requirements of authorities having jurisdiction for installation and testing of TRCES. Install all electrical wiring to comply with requirements in NFPA 70.
- C. Arrange equipment cabinets, wire-ways, and conduits with adequate clearances to facilitate access for inspection, maintenance, and component replacement.
- D. Install equipment cabinets with top and bottom of cabinets not more than 72 inches above finished floor and not less than 12 inches above finished floor, respectively.
- E. Install battery cabinets with top and bottom of cabinets not more than 48 inches above finished floor and not less than 12 inches above finished floor, respectively.

- F. Install equipment cabinets with user displays and/or controls including fire alarm control unit nodes and remote annunciators with displays and/or controls at natural user height.
- G. Flush-mount equipment cabinets/back-boxes not located in designated equipment rooms.
- H. Surface-mount equipment cabinets/back-boxes located in designated equipment rooms.
- I. Install outdoor donor antenna with clear view to donor site with a minimum 2-ft vertical clearance above nearby obstacles.
- J. Secure outdoor donor antenna to mounting mast in accordance with manufacturer requirements.
- K. Install NFPA 780 compliant lightning protection at connection to outdoor donor antenna.

### 3.4 CABLE AND PATHWAY INSTALLATION

- A. Comply with NFPA 70, NFPA 72/1221, and requirements of authorities having jurisdiction.
- B. Comply with Division 28.

### 3.5 INSTALLATION FOR SURVIVABILITY

- A. Where NFPA 72/1221 Survivability Level 2 or 3 pathways are indicated or required, install cables and pathways within 2-hr fire resistance rated enclosures or comply with Division 28 for fire resistive pathway installation.
- B. Install BDA units, power supplies, junction boxes, terminal cabinets, or similar components within dedicated 2-hr fire resistance rated fire alarm system equipment rooms if the components originate or comprise a portion of a NFPA 72/1221 Survivability Level 2 or 3 pathway.

### 3.6 IDENTIFICATION

- A. Identify system components, wiring, cabling, and terminals. Comply with Division 26.
- B. Comply with AHJ requirements for TRCES component identification.

### 3.7 GROUNDING

- A. Comply with Division 26.
- B. Comply with each TRCES component's manufacturer installation guidelines for grounding.

### 3.8 FIELD QUALITY CONTROL

- A. Components installed but not yet placed in service shall be protected from construction dust, debris, dirt, moisture, and damage according to manufacturer's written storage instructions.
- B. Components placed in service before all other trades have completed cleanup shall be replaced.
- C. Field inspections and testing shall be performed by factory-authorized service technicians.
- D. Prepare a typewritten computer-output Test Plan that clearly establishes the scope of TRCES testing. Include at a minimum testing methods, personnel, duration, and required coordination for integrated testing of fire alarm system interfaces.
- E. Functional field tests shall be witnessed by the Construction Manager (CM) and their designees; provide notifications a minimum of two (2) weeks in advance.

- F. Acceptance field testing shall be witnessed by the CM, their designees, and authorities having jurisdiction (AHJ); provide notifications a minimum of two (2) weeks in advance.
- G. Perform visual inspections in accordance with NFPA 72/1221. Correct deficiencies.
- H. Document inspections via formal check-list format or AHJ approved format report.
- I. Provide written notifications for functional field tests; include Test Plan.
- J. Perform functional testing in accordance with NFPA 72/1221 and AHJ requirements for plotted interior building RF signal strength and/or delivered audio quality (DAQ) score. Correct deficiencies.
- K. Document 100 percent satisfactory functional tests via AHJ approved report format.
- L. Provide written notifications for acceptance field tests; include Test Plan, Inspection Report, and Functional Test Report.
- M. Perform acceptance field testing. Demonstrate system operation to the satisfaction of the AHJ. Correct AHJ noted deficiencies.
- N. Place system into normal operating service without system faults or outstanding work.

### 3.9 MAINTENANCE SERVICE

- A. Initial Maintenance Service: Beginning at Substantial Completion, maintenance service shall include **twelve (12)** months' full maintenance by skilled and certified employees of manufacturer's designated service organization. Include preventive maintenance, repair or replacement of worn or defective components, lubrication, cleaning, and adjusting as required for proper operation. Parts and supplies shall be manufacturer's authorized replacement parts and supplies.
  - 1. Perform visual inspections at intervals required by NFPA 72/1221 and the AHJ.
  - 2. Perform tests at intervals required by NFPA 72/1221 and the AHJ.

### 3.10 DEMONSTRATION

- A. Engage a factory-authorized service representative to train Owner's maintenance personnel to adjust, operate, and maintain fire alarm system.

END OF SECTION

## SECTION 312000 – MONITORING OF ADJACENT STRUCTURE

### PART 1 - GENERAL

#### 1.1 SUMMARY

- A. Monitoring of existing structures shall be performed in accordance with the requirements of the Contract Documents.
- B. Work in this Section includes, but is not necessarily limited to the following:
  - 1. All labor, materials, equipment, and services necessary to document conditions and protect existing structures (including but not limited to buildings, roadways, sidewalks, walls) from damage during construction.
  - 2. All engineering, surveying, layout, monitoring, and submittals in connection with the work in this Section.
  - 3. Documentation of pre-construction conditions of adjacent structures, buildings and streets.
  - 4. Survey monitoring of adjacent structures and nearby buildings for the duration of construction.
  - 5. Crack propagation monitoring of adjacent structures and nearby buildings for the duration of construction.
  - 6. Vibration monitoring of adjacent structures and nearby buildings during excavation, foundation installation and other below-grade construction for the duration of construction.
  - 7. Review of existing relevant, subject buildings and structural drawings as needed to perform a structural stability assessment by a New Jersey State licensed professional engineer engaged by the Contractor.
  - 8. Other labor and materials as may be reasonably inferred to be required to make the work under this Section complete.
- C. Related Work Specified elsewhere:
  - 1. Section 312000 – Earthwork
  - 2. Project Specifications and Contract Drawings
  - 3. In case of conflict the most stringent shall apply.
- D. Definitions:
  - 1. Where “structure” is used herein, it shall include all buildings, tunnels, sheds, roadways, sidewalks, utilities, poles, curbs, pavements, and other appurtenances which are to remain during construction.
  - 2. “Review Level”: The instrumentation value above which will trigger the evaluation of current construction methodology and, if necessary, implementation of mitigative action as shown in this specification to avoid detrimental effects on the surrounding facilities.
  - 3. “Alert Level”: The instrumentation value above which will halt the construction, require evaluation of subject, relevant structures affected, and necessitate mitigative action as

shown in this specification to prevent damages to surrounding structures. The action must be such that the Alert Level is not exceeded in subsequent construction.

## **1.2 REFERENCES**

- A. All work shall comply with all applicable codes and regulations having jurisdiction, including but not limited to the requirements of the 2021 International Building Code New Jersey edition (Building Code).
- B. United States Bureau of Mines (USBM), Report of Investigations (RI) 8507, "Structure Response and Damage Produced by Ground Vibrations from Surface Blasting," by D. E. Siskind, M. S. Stagg, J. W. Kopp, and C. H. Dowding, dated 1980.
- C. Deutsche Institut für Normung (DIN) 18723 – Field Procedure for Precision Testing of Surveying Instruments.
- D. National Institute of Standards and Technology (NIST).
- E. The following project-specific documents shall be referenced for the work of this Section:
  - 1. Project Specifications and Contract Drawings
  - 2. Geotechnical Engineering Report prepared by Langan Engineering, and Environmental Services, LLC dated 3 May 2024.
- F. In case of conflict, the most stringent shall apply

## **1.3 SUBMITTALS**

Unless noted otherwise, the contractor shall prepare and submit the following items to the engineer for approval at least 30 days before the start of said work. All submittals shall be prepared and signed by a licensed land surveyor or licensed professional engineer.

- A. Submit documentation verifying that those performing the monitoring program have the required qualifications as specified herein.
- B. Survey Monitoring: The Contractor shall submit a survey monitoring plan prepared by a licensed professional land surveyor. The plan shall show the location of all installed monitoring points and the survey benchmark(s) that will be used for optical survey monitoring. Submit monitoring plan and periodic elevation and lateral position control point monitoring data for temporary support of excavation (SOE) and underpinning systems, neighboring/bordering structures, lots, walkways and adjacent sidewalks as specified herein.
- C. Provide proposed method and locations of elevation and lateral position control points to be established to monitor any vertical and horizontal movements during excavation and sheeting, bracing, and underpinning installation.
- D. Provide results of monitoring point survey within 24 hours of taking the readings.
- E. Weekly Reports: Weekly monitoring reports shall be submitted to the Owner's Engineers for review. The reports shall include incremental and cumulative deviation in vertical, longitudinal, and transverse axes; vertical and horizontal deviation at crack gauges; elevation of and change in groundwater level at observation wells; maximum daily peak particle velocity in vertical, longitudinal, and transverse axes; waveform recording of vibrations that exceed the threshold specified below.
- F. Vibrations: Submit a plan prepared by a licensed professional engineer showing the locations of the vibration monitoring devices. The vibration monitoring readings shall be provided to

Owner, Construction Manager and Geotechnical Engineer real time via remote notification.

- G. Crack Propagation: Submit a plan prepared by a licensed professional engineer showing the locations of the installed crack propagation monitoring devices (gages or reference lines). The readings shall be taken once a week and shall be submitted to Owner, Construction Manager and Geotechnical Engineer within 24 hours of the readings.

#### 1.4 QUALITY ASSURANCE

- A. Optical survey monitoring shall be performed by a Professional Land Surveyor licensed in the state of New Jersey with a minimum of three years of experience (or as approved by the Engineer) in deformation measurements of the types and accuracies specified herein.
- B. Crack propagation and vibration monitoring shall be performed under the supervision of a Professional Engineer licensed in the State of New Jersey with a minimum of 3 years of experience (or as approved by the Engineer) in monitoring of the types and accuracies specified herein.
- C. The engineer responsible for Structural Stability of adjacent structures shall be a Professional Engineer licensed in the State of New Jersey State with a minimum of 5 years of experience (or as approved by the Engineer) in performing structural stability assessment.

#### 1.5 PROJECT CONDITIONS

- A. Prior to entering a bid, the Contractor shall visit the site and become familiar with all existing conditions. Surrounding buildings, below grade structures, trees and utilities shall be inspected by the Contractor prior to entering a bid. The Contractor shall review the above mentioned geotechnical engineering report and contract documents to familiarize himself with the existing conditions.
- B. The project site is located within the north portion of the WPU campus in a tiered parking area. The site is bound by University Drive to the north and east, the existing recreation center building to the south and Mills Drive to the west. Century and Skyline Halls are to the southwest of the site and a soccer field is to the south of the existing recreation center. A steep drop off with an existing brook is located to the southeast and east of the site.
- C. The subject area is immediately north of the Sports and Recreation building that is to remain. It is currently occupied by stepped parking lot with solar canopies.
- D. The work area is limited to the property limits. Contractor shall assume that there is no access to the adjacent properties. All adjacent structures, properties and streets shall be protected and shall be taken into account for shoring, underpinning and dewatering.
- E. The work shall be executed so that no damage or injury will occur to the existing adjoining or adjacent structures, streets, walkways, trees or utilities. Should any damage or injury occur that is caused by the Contractor, or by anyone in Contractor's employ, or by the work under this Contract, the Contractor shall repair such damage at his own expense and shall assume all responsibility for such injury.
- F. Structures that are within 30 feet lateral distance of the proposed construction consist of "Buildings/Structures of Interest" for Preconstruction Documentation and Monitoring Purposes. The buildings/structures of Interest include but not limited to the following:
  - 1. Existing Sports and Recreation Building
  - 2. Solar Panels

3. Temporary Support of Excavation (SOE) Systems, if any, (monitoring purposes only)
  - B. Contractor and its engineer shall obtain and review all available existing buildings information and verify the as-built information (levels, depths, dimensions, elevations etc) of the subject buildings prior to design and construction. By submitting his design, it shall be assumed that the Contractor and its engineer verified all the as-built conditions.
  - C. No guarantee is expressed or implied for the inferred information based on the subsurface logs and profiles provided in the geotechnical study mentioned above. No information derived from such boring logs or plans will, in any way, relieve the Contractor from the responsibility of making his own evaluations, inspections and determinations in regards to the conditions at the site. The Contractor shall make his own assumptions of subsurface conditions that may affect methods of construction of the work hereunder, and he agrees that he will make no claims for damages or compensations, except as are provided under the agreement, should he find conditions during the progress of the work different from those as calculated and/or anticipated by him. Additional borings and other exploratory operations may be performed by the Contractor, at the Contractor's expense and following the Owner's approval. No change in the Contract Sum will be authorized for such additional exploration undertaken by the Contractor.
  - D. The locations of utilities shall be verified in the field by the Contractor prior to the installation. Protection of all utilities located on the site is the sole responsibility of the Contractor.
  - E. The Contractor, by careful examination, shall inform himself of the nature and location of the work, the conformation of the ground, the nature of the subsurface conditions, the locations of the groundwater table, the character, quality and quantity of the materials to be encountered, the character of the equipment and facilities needed prior to and during the execution of the work, and all other matters which can in any way affect the work.
  - F. The Contractor shall be held to have visited the site and to have familiarized himself with the existing conditions of adjoining properties, utilities and buildings.
  - G. The Contractor shall investigate the conditions of public thoroughfares and roads as to availability, clearances, loads, limits, restrictions, and other limitations affecting transportation, and ingress and egress to/from the site of the work. The Contractor shall conform to all local, New Jersey State, and Federal regulations in regard to the transportation of materials to, from, and at the job site and shall secure in advance such permits as may be required.
  - H. The Contractor shall investigate the existing conditions present within the project area prior to mobilization of any equipment. The Contractor shall inform himself of limitations to vertical and horizontal clearances, restrictions, and other limitations affecting transportation to, ingress and egress of the locations of the proposed work.
  - I. The Contractor shall perform the work of this Section in a manner that will result in no harmful effects to existing on-site or off-site structures. Any damage to structures resulting from the Contractor's work shall be the sole responsibility of the Contractor.
  - J. Existing Utilities: Prior to start of work locate existing underground utilities in and beyond the areas of work. If utilities are indicated to remain in place, provide adequate means of support and protection during the work. Should uncharted, or incorrectly charted, piping or other utilities be encountered during excavation, consult utility owner immediately for directions. Cooperate with Owner and utility companies in keeping respective services and facilities in operation. Repair damaged utilities to satisfaction of utility owner.
    1. Should uncharted, or incorrectly charted, piping or other utilities be encountered during excavation, consult utility owner immediately for directions. Cooperate with the Owner

and utility companies in keeping respective services and facilities in operation. Repair damaged utilities to satisfaction of utility owner.

2. Do not interrupt existing utilities serving facilities occupied by the Owner or others, during occupied hours, except when permitted in writing by the Construction Manager and then only after acceptable temporary utility services have been provided. Provide minimum of 48 hour notice to the Construction Manager, and receive written notice to proceed before interrupting any utility.
  3. Demolish and completely remove from site existing underground utilities indicated to be removed. Coordinate with utility companies for shutoff of services if lines are active.
- K. Examine drawings to determine sequence of operations and relation to work of other trades. Start of work will signify acceptance of field conditions and will acknowledge coordination with other trades.
- L. Comply with all federal, state and local environmental and health and safety regulators, including but not limited to Occupational Safety and Health Administration (OSHA).
- M. Comply with all campus required environmental and health and safety guidelines.

## **PART 2 - PRODUCTS**

### **2.1 MONITORING EQUIPMENT**

- A. Optical Survey Monitoring Points and Equipment
1. Optical monitoring points on buildings for vertical and lateral displacement shall be mountable targets or prisms.
  2. Settlement monitoring points may be set using pins or cross hatches in the structure to be monitored.
  3. Accuracy of the survey monitoring readings shall be within 1/16 inch (0.005 ft) or better. Use appropriate calibrated survey equipment and procedures to achieve the specified accuracy level operated by qualified licensed land surveyors. Check benchmarks with off-site monuments/benchmark before each round of readings.
- B. Crack Gauges
1. If allowed by the Property Owner, clear plastic crack gauges with reference line and measuring grid shall be used. Crack gauges shall be attached to structures using epoxy or bolts in accordance with manufacturer's recommendations. Photographic documentation should be used for monitoring.
  2. If the Property Owner will not allow installation of crack gauges, reference lines may be used. A reference line should be drawn across and perpendicular to the crack. Two measurement points (one on either side of the crack) should be drawn and the initial distance between the two measurement points recorded for future comparison. Measurements should be taken in 1/32-inch increments.
- C. Vibration Monitoring Equipment
1. Portable seismographs with the ability to record vibration events up to 10 inches per second (in/sec) with an accuracy of  $\pm 5\%$  over a range of frequencies from 2 to 250 Hz.
  2. Seismographs shall have the ability for remote monitoring and shall be set up to send recorded data at least twice daily and send out immediate, automatic alerts if threshold

values are exceeded.

### **PART 3 - EXECUTION**

#### **3.1 PROTECTION OF ADJACENT STRUCTURES**

- A. The project site is an urban area and there are structures adjacent to and within the vicinity of the site. The work shall be executed so that no damage or injury will occur to the existing adjoining or adjacent structures, subject landmark buildings, streets, railroads, paving, sewers, gas, water, electric or any other utilities. Should any damage or injury occur that is caused by the Contractor, or by anyone in Contractor's employ, or by the work under this Contract, the Contractor shall repair such damage at his own expense and shall assume all responsibility for such injury.
- B. The above shall also include the protection of all existing utilities (including sewers, water lines, electrical lines and telecommunication lines) to remain in use within and adjacent to the area affected by the work of this project.
- C. Prior to commencement of any work, consult the records for existing utilities, and note all conditions and limitations which might affect the work required under this Section. The Contractor shall not damage any utilities that are to remain and shall leave them accessible.
- D. Monuments, benchmarks and other reference features on streets bounding this project, shall be protected. Should these be disturbed in any manner, the Contractor shall have them replaced at no cost to the Owner.

#### **3.2 PRE-CONSTRUCTION CONDITIONS DOCUMENTATION**

- A. General: The Owner's Consultant shall perform a pre-construction condition documentation of all the adjoining properties, structures, buildings, walkways and roadways which are within the lateral distance of the construction site specified in Part I of these specifications. The "buildings/structures of interest" are identified in Part 1 of these specifications.
- B. The documentation shall document conditions of the structures of interest prior to construction work and shall be used as a reference document for potential claims. The documentation shall include photographs, sketches, crack reference lines, movement control points and measurements of ambient vibrations. Crack monitoring gages or crack reference lines shall be installed on existing structural cracks. Locations of the lateral and vertical movement monitoring points shall be chosen in advance for monitoring during construction. Ambient vibrations shall be measured. The documentation shall serve as a pictorial and quantitative reference document to assess conditions prior to, during, and after construction.
- C. Photographs: Take photographs of the building walls of the adjoining properties and existing school (if applicable) so that the surfaces may be examined during construction and compared with the pre-work condition. If any cracks or other stress signs are exhibited by the buildings, halt operations until corrective action has been provided and is acceptable to the Owner.
- D. Crack Reference Lines/Gauges: Install several crack monitoring gauges or lines on any nearby existing crack on adjacent properties. Monitor the lines/gauges during construction and compare with the pre-work condition. If increased stress signs are observed on the crack reference lines/gauges, halt operations until corrective action has been provided and is acceptable to the Owner.
- E. Movement Control Points: Choose or identify location of the movement (vertical and lateral) points on the adjacent structures of interest for monitoring during construction. The land

surveyor retained by the contractor will install these points and will monitor during construction.

- F. Vibration: Measure ambient vibration levels using a seismograph near each structure/building of interest.
- G. A copy of the pre-construction conditions documentation of the subject structures will be made available to the Contractor upon contract award.
- H. The Contractor may perform, if he wishes, his own conditions verification survey and shall submit any findings that differ from the Owner's Engineer's documentation at least 20 work days before beginning the work.
- I. Before starting work, the Contractor's Professional Engineer and Land Surveyor shall check and verify governing dimensions and elevations, survey conditions of adjoining properties and historic landmark buildings, and record any prior settlement or cracking of structures, pavements, and other improvements. The Contractor shall video all relevant, subject structures prior to the beginning of any construction activities.

### **3.3 MONITORING OF EXISTING STRUCTURES**

- A. For this project, the buildings, structures, elements of interest for monitoring purposes are identified in Part 1 of these specifications.
- B. Vertical and Lateral Displacements -
  - 1. Monitor each building/structure/element of interest within 30 feet of the site laterally.
  - 2. Install a minimum of 10 optical survey monitoring points on the existing recreation building northern most facade (minimum of 5 sets of 2 points each – each set consisting of one point within the lower level or street level and one point at the roof line or upper portion of building) for monitoring vertical and lateral displacement. A minimum of 5 optical survey monitoring points shall be placed on the solar canopies north of the site. Monitoring locations shall not be spaced at intervals exceeding 25 feet laterally. Install additional sets of monitoring points as necessary to maintain this spacing. Install monitoring points on the building facades facing the construction site.
  - 3. Install a minimum of 10 settlement monitoring points (at 25 feet on center) on the adjacent sidewalks, roadways and adjacent building entryways for monitoring vertical displacement.
  - 4. The Contractor shall install and monitor points at a maximum horizontal spacing of 25-feet on-center around the entire perimeter of the excavation, to monitor the ground movements behind the support of excavation (SOE). As the excavation proceeds, install points on the SOE elements (at the top of excavation) to measure potential lateral deflection. These locations shall be subject to review by the Engineer of Record for the excavation support system.
  - 5. All monitoring locations shall be subject to review by the Owner's Engineers.
  - 6. The monitoring points shall be established and monitored by the Contractor employing a Professional Land Surveyor licensed in the State of New Jersey, and referenced to a fixed, off-site benchmark.
  - 7. The Contractor may establish additional monitoring points on the existing adjacent structures, subject to the Property Owner's approval, to adequately monitor and otherwise keep himself informed of the structures' conditions during the work.

**C. Crack Gauge Monitoring**

1. Install crack gauges at large visible cracks in the walls, foundation walls on the buildings/structures of interest to monitor changes in crack width during construction. Initial conditions of the crack gauges shall be measured and/or documented photographically.
2. Location of crack gauges shall be selected by agreement between the building owner, Contractor, the engineer responsible for Structural Stability and the Owner's Engineer.

**D. Vibration Monitoring**

1. 1 seismograph is are to be installed at the lowest level of the recreation building at a point closest the construction anticipated to cause maximum vibrations (e.g. demolition, excavation, foundation construction).
2. Alerts shall be sent out automatically to designated recipients (Owner's Engineer, Owner's Representative, Contractor, and engineer responsible for Structural Stability) if threshold levels specified below are exceeded.
3. Waveform recording of vibrations shall be provided for vibration events exceeding a peak particle velocity of 0.25 inches per second as measured along any axis.

**3.4 FREQUENCY AND REPORTING**

**A. Optical Survey Monitoring of Displacements**

1. Monitoring shall be performed at least once weekly (one reading per week) by the Contractor's Professional Land Surveyor during demolition and all below-grade construction (soil and rock excavation, support of excavation work, cut stabilization, underpinning, or foundation construction) until the first floor slab is constructed. The accuracy (margin of error) of the survey readings shall be 0.005 feet (1/16 inch) or better. All monitoring data shall be transmitted to the Owner on a weekly basis.
2. After the first floor slab has been poured, monitoring shall be performed once monthly by the Contractor's Professional Land Surveyor until building top-off. All monitoring data shall be transmitted to the Owner on a monthly basis.

**B. Crack Gauges:** Crack gauges shall be monitored once a week during demolition and below-grade construction activities. Monitoring shall consist of measuring the distance between the points established during installation or by documenting the crack gauge photographically.

**C. Vibrations:** Vibration monitoring shall be performed on a continual basis during demolition and foundation construction and below-grade construction activities.

**D. Should movements or vibrations exceed the specified thresholds, monitoring intervals shall be increased to daily unless otherwise instructed by the Owner's Engineer.**

**3.5 ALERTING**

- A. Alerts shall be generated when data collected are determined by those responsible for that aspect of monitoring to have reached or exceeded the Review and Alert Level thresholds as defined herein.
- B. Alerts for Review and Alert Level thresholds shall be promptly forwarded to the Construction Manager, Owner, and Owner's Engineer. The alert shall contain the monitoring point that has exceeded its Review and Alert Level threshold, the data, the date and time of the reading, the reading value and the Review or Alert Level. For vibrations exceeding the Review or Alert Level

thresholds, the alert should include the waveform recording of the vibrations.

- C. The alert system shall include a means for the recipient of the alert to acknowledge that the alert has been received and to disable repeated alarming on that sensor.
- D. The Contractor shall make every effort to work with those responsible for monitoring to provide timely readings for review of data and sending of alerts.

### 3.6 THRESHOLD LIMITING VALUES

- A. The Contractor shall take every precaution to guard against excessive movement, settlement, groundwater drawdown, vibration, or damage of adjacent buildings and structures. The Contractor is solely and entirely responsible for the safety and support of such structures, and liable for any damage and injury caused thereby or resulting therefrom.
- B. The following Review Level Thresholds shall require that the Contractor cease construction, review their means and methods of construction and suggest revised means and methods to limit movements and vibrations in adjacent structures. A written description of revised means and methods must be submitted by the Contractor before work can proceed. The Review Level Thresholds are as follows:
  - 1. Vertical or Horizontal Displacements (Movements)
    - a. Buildings or other Structures or retaining walls: Two consecutive readings of 1/8 inch of movement, or one confirmed reading of ¼ inch.
    - b. Support of Excavation (SOE) Systems: Three consecutive readings of 1/8 inch of movement, or one confirmed reading of ¼ inch.
  - 2. Crack Gauges: three consecutive readings of 1-millimeter, or one confirmed reading of 3 millimeters.
  - 3. Vibrations
    - a. Buildings of Interest and Other Structures: Peak Particle Velocity exceeding 0.5 inches per second (ips) measured along any axis.
- C. The following Alert Level (Maximum Allowable) Threshold values shall require the Contractor to cease construction activities and notify the construction manager, Owner, Owner's Engineer immediately. The engineer for Structural Stability engaged by the Contractor will make an inspection of the affected building within 24 hours of the reported exceedances. The contractor's engineer will prepare a report assessing the condition of the affected building and any required remediation. The report will be submitted to the construction manager, the design team within 48 hours of the incident. Construction activities shall not continue until adequate measures are in place to achieve stability of adjacent structures or excavation support systems. Where significant movements are detected, the frequency of data collection shall be increased to once daily or as directed by the Owner's Engineer. The Alert Level (Maximum Allowable limits) Thresholds are as follows:
  - 1. Vertical and Horizontal Movements
    - a. Buildings or other Structures: 0.4 inch total vertical or 0.4 inch total horizontal.
    - b. Support of Excavation (SOE) Systems away from buildings: 0.5 inch total movement.
  - 2. Crack Gauges: 4 millimeter increase in crack width.

3. Vibrations: Buildings of Interest: Peak particle velocities (PPV) exceeding the USBM plot of allowable PPV versus frequency as published in RI 8507 (graphically shown below).

- D. Any movement or vibration levels exceeding the above criteria shall be reported immediately to the Owner. If the above thresholds are exceeded:
  1. The Contractor will immediately stop work in the vicinity of the exceedance.
  2. The engineer for Structural Stability engaged by the Contractor will make an inspection of the affected building or structure within 24 hours of the reported exceedances. The Contractor's engineer will prepare a report assessing the condition of the affected building and any required remediation. The report will be submitted to the construction manager and the design team within 48 hours of the incident.
  3. The Contractor shall develop alternate methods and procedures, subject to the review and approval of the Owner's Engineers and the affected building's engineers.
  4. Resume work using the agreed upon alternative method.
  5. Corrective measures to achieve stability of adjacent structures shall be the responsibility of the Contractor. The Contractor shall restore, to the satisfaction of the Property Owner, by repair or otherwise, the portions of buildings, or their contents, altered by the Contractor's work. Restoration shall be completed to the conditions which existed prior to the start of work.

### 3.7 CAMPUS REQUIREMENTS

- A. The campus may require more strict monitoring requirements for its structures. Contractor shall

#### MONITORING OF ADJACENT STRUCTURES

coordinate and comply with the monitoring criteria and frequency.

- B. The campus may establish more restrictive allowable movement and vibration criteria during construction. Contractor shall comply with the limiting criteria.

### 3.8 QUALITY CONTROL

A. Owner's Responsibilities

1. Preconstruction Conditions Documentation: The Owner will retain a qualified engineer who will perform the Preconstruction Conditions Documentation of the structures of interest.
2. Vibration Monitoring: The Owner will retain a qualified engineer, who will perform vibration monitoring.
3. Crack Propagation Monitoring: The Owner will retain a qualified engineer, who will perform vibration monitoring.
4. The owner will retain a geotechnical engineer who will review contractor's submittals and readings.

B. Contractor's Responsibility

1. The contractor shall cooperate with the owner's consultants and inspector when performing their specified monitoring.
2. Survey Monitoring: The Contractor shall retain a licensed surveyor who shall install and monitor lateral and vertical control points during construction. The licensed surveyor shall have at least 5 years of experience in such work and shall utilize the suitable precise equipment to measure the movements within the specified levels of accuracy.
3. Other: The Contractor shall be also responsible for retaining qualified professional engineers, certified testing agencies and licensed surveyors to perform inspection and monitoring services not specifically defined as being provided by the Owner.
4. Monitoring, inspections and testing performed by the Owner shall not relieve the Contractor of responsibility for performing all other monitoring, testing and inspection specified herein or otherwise necessary to meet the quality control and quality assurance requirements of this Section. No testing and/or analysis by the Owner shall relieve the Contractor of the responsibility of conforming to the requirements of these specifications.
5. Time for conducting the monitoring, tests and/or inspections defined in these specifications shall be considered as part of the Work of this Project and neither extension of time nor additional costs shall be accepted as a result

END OF SECTION 310913

\\langan.com\data\par\data2\101053201\project data\specifications\for bid\310913 - monitoring of adjacent structures.docx

## **SECTION 311000 - SITE PREPARATION**

### **PART 1 - GENERAL**

#### **1.01 SECTION INCLUDES**

- A. Cleaning site of debris, grass, trees, and other plant life in preparation for site or building earthwork.
- B. Protection of existing structures, trees, or vegetation indicated in Contract Documents to remain.
- C. Stripping topsoil from areas that are to be incorporated into limits of project and where so indicated on Construction Drawings.
- D. Removal of asphalt pavement and concrete slabs from areas that are to be incorporated into limits of project and where so indicated on Construction Drawings.

#### **1.02 RELATED SECTIONS**

- A. Section 011100 – General Requirements
- B. Section 024119.1 – Site Demolition
- C. Section 312000 – Earthwork
- D. Section 312200 – Erosion and Sedimentation Control
- E. Construction Drawings

#### **1.03 REFERENCE STANDARDS**

- A. New Jersey Soil Erosion and Sediment Control (SESC) Manual
- B. SESC Project Permit and Conditions

#### **1.04 ENVIRONMENTAL REQUIREMENTS**

- A. Construct temporary erosion control systems to protect adjacent properties and water resources from erosion and sedimentation.
- B. Owner will obtain the Soil Erosion and Sediment Control (SESC) permit governing the discharge of STORMWATER from the construction Site.
- C. Contractor shall be totally responsible for conducting soil erosion and sediment control and the storm water management practices and for enforcement action taken or imposed by Federal or State agencies, including cost of fines, construction delays, and remedial

actions resulting from Contractor's failure to comply with all provisions of the Federal or State agencies.

**1.04 PROJECT CONDITIONS**

- A. Conditions existing and described by the Owner at time of inspection for bidding purposes will be maintained by Owner in so far as practical.
- B. Variations to conditions or discrepancy in actual or described as proposed conditions as they apply to site preparation operations are to be brought to attention of Owner prior to commencement of sitework.

**PART 2 - PRODUCTS**

Off-site materials shall be transported to project using well maintained and operating vehicles. Once on site, transporting vehicles shall stay within limits of disturbance or on designated haul roads and shall at no time endanger improvements by rutting, overloading, or pumping.

**PART 3 - EXECUTION**

**3.01 PREPARATION**

Verify existing plant life that is to remain and any clearing limits are clearly tagged, identified, and marked in such manner as to insure their safety throughout construction operations.

**3.02 PROTECTION**

- A. Locate and identify existing utilities that are to remain and protect from damage.
- B. Protect trees, plant growth, wetlands and features designated to remain as part of final landscaping.
- C. Conduct operations with minimum interference to public or private accesses and facilities. Maintain ingress and egress at all times and clean or sweep roadways daily as required by the governing authority. Dust control shall be provided with equipment provided by Contractor.
- D. Protect benchmarks, property corners, and other survey monuments from damage or displacement. If marker needs to be removed it shall be referenced by licensed land surveyor and replaced, as necessary, by same.
- E. Provide traffic control as required, in accordance with the New Jersey Department of Transportation's rules and regulations and applicable State, Local and County requirements.

**3.03 CLEARING**

- A. Clear areas required for execution of work.

- B. Unless otherwise indicated on Construction Drawings, remove trees, shrubs, grass, other vegetation, improvements, or obstructions interfering with installation of new construction. Removal includes digging out stumps and roots. Depressions caused by clearing and grubbing operations are to be filled to subgrade elevation to avoid ponding of water. Satisfactory fill material shall be placed in accordance with Section 312000.
- C. Remove grass, trees, plant life, stumps, and other construction debris from site to disposal material that is suitable for handling such material in accordance with State, County and Local laws and regulations.

### 3.04 TOPSOIL EXCAVATION

- A. Topsoil shall consist of organic surficial soil typically found in depths of not less than 4-inches. Satisfactory topsoil to be recovered shall be reasonably free of subsoil, clay lumps, stones and other objects over 2-in. in diameter, weeds, roots, and other objectionable material.
- B. Cut heavy growths of grass from areas before stripping and remove cuttings with remainder of cleared vegetative material.
- C. Strip topsoil from areas that are to be filled, excavated, landscaped, or re-graded to such depth that it prevents intermingling with underlying subsoil or questionable material.
- D. Stockpile topsoil in storage piles in areas as directed by Owner. Construct storage piles to freely drain surface water. Cover storage piles as necessary to prevent windblown dust. Dispose of unsuitable topsoil as specified for waste material, unless otherwise specified by Owner. Excess topsoil shall be removed from site by Contractor unless specifically noted otherwise on Construction Drawings.
- E. Stockpiled topsoil shall be reused as general fill in landscaped areas as permitted by the Geotechnical Engineer and as specified in Section 312000.

### **END OF SECTION 311000**

\\langan.com\data\PAR\data2\101053201\Project Data\Specifications\FOR BID\311000 Site Preparation.docx

## **SECTION 311500 - PROJECT SURVEY AND LAYOUT**

### **PART 1 GENERAL**

#### **1.01 WORK INCLUDED**

- A. The Contractor shall employ a New Jersey Licensed Land Surveyor for necessary surveying required to construct all elements of the Project as shown on the Contract Drawings and specified herein. The Contractor will also provide additional horizontal and vertical control points along the project area as required for construction or as directed by the Owner's Engineer.
- B. All surveys shall be signed and sealed by the Contractor's Land Surveyor, licensed to practice in the State of New Jersey.
- C. All project installations improperly constructed as a result of inadequate or erroneous survey layout shall be properly relocated by the Contractor at no cost to the Owner.

#### **1.02 RELATED SECTIONS**

- A. Section 31200 - Earthwork
- B. Section 334200 - Sanitary Sewer System
- C. Section 265615 - Site Lighting
- D. Section 334100 - Storm Drainage
- E. Section 321216 - Asphaltic Concrete Paving
- F. Section 321315 - Curbs and Sidewalks
- G. Contract Drawings

#### **1.03 REFERENCE STANDARDS**

In accordance with local rules and regulations.

#### **1.04 QUALITY ASSURANCE**

- A. All construction layout work shall be performed under the direction of a Professional Land Surveyor.
- B. The survey crew will discuss all layout procedures with the Contractor's supervisor prior to commencing work.
- C. The survey crew daily report shall be filled out and signed by the Contractor's supervisor at the end of that day's layout.

- D. Copies of sketches, cut sheets, etc. shall be provided to the Contractor by the end of the next workday.
- E. All costs related to re-staking due to construction or Contractor's work resulting in destruction or movement of stakes shall be paid for by the Contractor and at no additional expense to the Owner.
- F. Building dimensions to be coordinated with approved architectural plans.

## **PART 2 PRODUCTS**

### **2.01 MATERIALS**

Provide all instruments, equipment, stakes, marking paints and other materials necessary to perform the work satisfactorily.

## **PART 3 EXECUTION**

### **3.01 GENERAL**

- A. Qualified personnel and adequate equipment shall be made available by the Contractor to maintain control points and layout all lines and grades throughout the duration of the Contract.
- B. The exact position of all work points shall be established from control points, base line transit points and/or other points of similar nature based upon information provided in Contract Documents.
- C. The Contractor shall establish, re-establish when necessary and maintain control points throughout the life of the Contract to permit the Engineer to make the necessary preliminary, interim and final measurements and to check the Contractor's layout.
- D. The Contractor shall be responsible for the preservation of all control points. If control points are damaged, lost or moved, they shall be reset at no additional expense to the Owner. Control points outside as well as inside the Contract Limits shall be used for construction.
- E. The Contractor shall provide and maintain offset stakes for each base line, at each station, and out of the limits of grading and construction. Each stake shall be identified and marked to show the offset distance from the base line and the Contractor shall furnish sheets showing cuts and fills to the finished profile and cross section lines.
- F. Any error, apparent discrepancy or absence of data shown or required for accurately accomplishing the survey work shall be referred to the Owner's Engineer for interpretation or furnishing when such is observed or required.
- G. The Owner's Engineer may check all or any portion of the survey work or notes made by the Contractor. Any necessary correction to the work shall be made immediately by the

Contractor. Such verification by the Owner's Engineer shall not relieve the Contractor of any responsibilities for the accuracy and completeness of his work.

- H. The Contractor shall keep a survey transit and level with tripod and survey rod on the project at all times to be used for checking inverts, surveyor's stakes, etc.
- I. The Contractor shall submit all survey data for daily checks, to the Office of the Owner's Engineer after the data is obtained.
- J. The Contractor shall submit cut sheets for the Owner's Engineers approval prior to any construction activity, for the purpose of verifying the construction layout. Cut sheets for any particular item of work shall be submitted prior to the need for approval. All cut sheets shall be prepared by a Licensed Land Surveyor and shall bear his seal and signature.
- K. In cases where extra excavation is required, before and after cut sheets shall be submitted for determination of quantities for excavation and backfill and extra bedding.
- L. All project installation improperly constructed or located as a result of inadequate or erroneous survey layout shall be relocated or reconstructed, after demolition and/or removal of the improper work as necessary, by the Contractor at no charge to the Owner.

### 3.02 LAYOUT

- A. Building Layout – Set a minimum of 4 corners.
- B. Curb Layout – Stakes will be located at 50-ft stationing and also at the point of curvature, points of tangency and radius points with 4-ft offsets to the face of the curb. Cut sheets shall be provided to the Contractor by the Surveyor.
- C. Storm drainage and sanitary sewer lines (including manholes and catch basins) – Stakes will be located at 50-ft stationing along the centerline of the utility at 15-ft offsets. Manholes and catch basins will have 2 offsets per structure. Cut sheets shall be provided to the Contractor by the Surveyor.
- D. Water Layout – Offset stakes will be located at deflections and at hydrant locations. Hydrant elevations will be to grade ring.
- E. Lighting Layout – Centerline of lighting structure with 5-ft offsets and finished grade elevations.
- F. Allowable tolerances for the project shall be generally as follows:
  - 1. Structural work, site furnishings: horizontal location 0.1 feet; vertical elevation 0.01 feet.
  - 2. Paving, fine grading: vertical elevation 0.1 feet.
  - 3. Trees: horizontal location 0.5 feet.

## **SECTION 312000 - EARTHWORK**

### **PART 1 – GENERAL**

#### **1.01 SECTIONS INCLUDES**

- A. Cutting, proofrolling, filling and grading to required lines, dimensions, contours and elevations for proposed improvements as shown on the Contract Drawings.
- B. Removal of above-grade rubble, curbs, pavement, slabs, and all other above-grade items that will interfere with the proposed work.
- C. Removal of below-grade elements, including concrete foundations, walls, existing utilities, and all other below-grade items that will interfere with the proposed work.
- D. Removal and legal disposal of material deemed by Owner's Geotechnical Engineer to be geotechnically unsuitable for reuse as on-site fill, to ensure proper preparation of areas for the proposed improvements.
- E. Excavation for utilities, structures, foundations, walls, and slabs.
- F. Excavation of soil and rock.
- G. Segregation and stockpiling of excavated soils.
- H. Off-site disposal of excavated soils/rock.
- I. Dewatering as necessary and in accordance with the requirements of this section.
- J. Scarifying, compaction, moisture content control of final subgrade and fill materials.
- K. Placing and compacting fill where indicated on Contract Drawings.
- L. Provide temporary excavation support as necessary.
- M. Backfilling utility trenches with bedding material (as specified) and suitable fill materials.
- N. All excavations (soil and rock), preparations and improvements required to provide satisfactory subgrades and to construct foundations, slabs, pavements, walls, pits, below grade structures, manholes, areaways, utilities and landscaping as required and indicated on drawings or to a lower elevation to achieve required bearing.
- O. Proof rolling, filling and grading to required lines, dimensions, contours and elevations for proposed improvements.
- P. Stabilization of soil cuts and rock cuts including, but not limited to, shoring and bracing, anchors, rock bolts and steel netting, if required.
- Q. Monitoring of adjacent structures and roadways during construction.

- R. Other labor and materials as may be reasonably inferred to be required to make the work under this Section complete.
- S. Requirements of the construction contract.
- T. Placement of drainage fill/ bedding layer and drainage pipes under building slabs on grade and elsewhere as indicated.
- U. Placement of vertical drainage mats behind foundation walls.
- V. Placement of perimeter drainage system behind foundation walls
- W. Processing of on-site materials for reuse.
- X. Performing soil testing and inspection services.
- Y. All other site preparation and earthwork specified herein as necessary to make the work of this Section complete.

#### 1.02 RELATED SECTIONS AND DOCUMENTS

- A. Section 310913 – Monitoring of Adjacent Structures
- B. Section 331000 – Protection of Existing Utilities
- C. Section 311000 – Site Preparation
- D. Section 315000 – Temporary Excavation Support and Underpinning
- E. Section 334200 - Sanitary Sewer Systems
- F. Section 334300 - Sewer Manholes, Frames, and Covers
- G. Section 334100 - Storm Drainage
- H. Section 312100 - Aggregate Materials
- I. Section 265615 – Site Lighting
- J. Section 312333 - Excavation, Backfill, And Compaction for Utilities
- K. Section 313200 - Soil Stabilization
- L. Section 332334 -Excavation, Backfill, And Compaction for Pavement
- M. New Jersey Soil Erosion and Sediment Control (SESC) Manual
- N. SESC Project Permit and Conditions

- O. 3 May 2024 Geotechnical Engineering Study Report prepared by Langan Engineering and Environmental Services, LLC. (Langan)
- P. In case of conflict, the most stringent shall apply.

#### 1.03 REFERENCE STANDARDS

- A. American Society for Testing and Materials (ASTM) – latest edition
  - 1. D422 Method for Particle Size Analysis of Soils
  - 2. D1557 Test for Moisture-Density Relations of Soils Using 10-lb (4.5 Kg) Hammer and 18-inch (457 mm) Drop (Modified Proctor)
  - 3. D2216 Laboratory Determination of Moisture Content of Soil
  - 4. D2487 Classification of Soils for Engineering Purposes
  - 5. D2922 Tests for Density of Soil and Soil – Aggregate in Place by Nuclear Methods (Shallow Depth)
  - 6. D3017 Test for Moisture Content of Soil and Soil-Aggregate in Place by Nuclear Methods (Shallow Depth)
  - 7. D 4253 - Test Method of Maximum Index Density and Unit Weight of Soils Using a Vibratory Table.
  - 8. D 4254 - Test Methods for Minimum Index Density and Unit Weight of Soils and Calculations of Relative Density.
  - 9. D 4318 - Test for Plastic Limit, Liquid Limit, and Plasticity Index of Soils.
- B. 2021 International Building Code New Jersey Edition.
- C. The current specifications of the New Jersey Department of Transportation (NJDOT) as amended and supplemented herein, shall be followed for all earthwork.
- D. The latest New Jersey Department of Environmental Protection (NJDEP) Regulations.
- E. The latest American Association of State Highway and Transportation Officials (AASHTO) regulations.
- F. OSHA Regulations - 29 CFR 1926 Subpart P.
- G. In case of conflict, the most stringent shall apply.

#### 1.04 DEFINITIONS

- A. Wherever the word "excavating", "excavate", "excavation", "carried down", "remove", etc., are used, they shall be taken to include the removal of all existing work, including brick

work, rubble work, rubbish, earth, as well as rock, boulders, steel grillages and concrete and all other materials and obstructions encountered; they shall also be taken to include all sheet piling, bracing, pumping, and all operations and items needed for the proper execution of the work. All excavation in soil and rock is considered unclassified.

- B. For the purpose of these specifications, rock is defined as any solid material that cannot be excavated or removed with reasonable effort by a large hydraulic excavator equipped with hardened rock teeth such as Caterpillar CAT 349F excavator with a minimum 396 horsepower (hp) net flywheel power.
- C. Where the words "finished grades", "finished grade lines", or "future finished grades", appear in these specifications, they shall be taken to mean the finished elevations as indicated on the drawings.
- D. Rough grading consists of cutting or filling to the elevation herein established with a permissible tolerance of plus or minus 1 inch. This tolerance shall be so used within any area of 100 square feet that it will not be necessary to remove excess or bring in additional fill to meet the required elevations.

#### 1.05 QUALITY ASSURANCE

- A. Provide at least one supervisory person who shall be present at all times during execution of the Work and who is thoroughly familiar with the type of Work being performed and its best methods for completion. This person shall have the authority to act on behalf of Contractor.
- B. Comply with any provisions of all applicable Federal, State, and Local requirements, codes, regulations and standards.
- C. The Geotechnical Engineer, selected and paid by Owner, will be retained to perform construction observation on-site based on density testing, visual observation, and judgment. Such observation shall not relieve Contractor from its responsibility to complete the Work in accordance with the plans and specifications. Visual field confirmation and density testing of subgrade preparation and fill placement procedures will be performed by field Geotechnical Engineer as part of the construction testing requirements. Geotechnical Engineer will be responsible for determining what material is geotechnically unsuitable.
- D. The Geotechnical Engineer shall prepare field reports that indicate compaction test location, elevation data, testing results and acceptability. The Owner, Architect, and Contractor shall be provided with copies of reports within 14 days of time test was performed.
- E. All costs related to re-inspection due to failures shall be paid for by the contractor at no additional expense to Owner. The Owner reserves the right to direct any inspection that is deemed necessary. Contractor shall provide free access to site for inspection activities.

#### 1.06 SUBMITTALS

- A. Contact all utility companies and identify any requirements that may impact Work of this section. Contractor shall submit written confirmation of the status of all utility construction to Owner no later than two (2) weeks prior to mobilization of equipment and materials to the Site.

- B. At least two (2) weeks prior to mobilization of equipment and materials to the Site, Contractor shall submit to Owner and Engineer a schedule detailing the sequence and time of completion of all phases of Work under this section.
- C. At least two (2) weeks in advance of imported fill delivery to the site for proposed use, Contractor shall submit the following laboratory test data to Geotechnical Engineer for each type of imported soil/gravel material to be used as compacted fill.
  - 1. Moisture and Density Relationship: ASTM D1557
  - 2. Grain Size Analysis: ASTM D4222

Together with the above test data, Submit a 25-pound sample of each type of proposed off-site fill material in an air tight container for the review and approval by Geotechnical Engineer. Submit the name and details of the source for the proposed material. Any change in source or soil type throughout the job requires approval of Geotechnical Engineer. Certification of environmental compliance for each type of proposed off-site fill material shall be submitted in accordance with the requirements of this Section.

- D. At least two (2) weeks prior to mobilization of equipment and materials to the Site, Contractor shall submit to Owner and Engineer evidence substantiating its experience and qualifications as required herein.
- E. At least two (2) weeks prior to mobilization of equipment and materials to the Site, Submit to Owner and Engineer a Health and Safety Plan.
- F. Contact utility companies and determine if additional easements or access permits will be required to complete project. Provide written confirmation of the status of all easements or access permits to Owner at time of Preconstruction Conference or no later than 90 days prior to project possession date.
- G. Samples:
  - 1. The Contractor shall submit a 25 lb representative sample of the proposed off-site fill materials (backfill, drainage fill etc.) to the Geotechnical Engineer for review and approval.
  - 2. The Contractor shall submit a 12 inch by 12 inch sample of geotextile fabric sample for review and approval.
  - 3. The Contractor shall submit a 12-inch-long drainage pipe sample for review and approval.
  - 4. The Contractor shall submit a 12-inch by 12-inch sample of the vertical drainage mat for review and approval.
  - 5. The Contractor shall submit a 12-inch by 12-inch sample of the plastic sheet vapor barrier for slab-on-grades for review and approval
- H. Test Reports:

1. Submit the test reports for each source of each fill material submitted for review and approval by the Geotechnical Engineer. Test reports shall include the results of the following tests:
  - a) Soil classification in accordance with ASTM D 2487
  - b) Moisture content in accordance with ASTM D 2216
  - c) Modified Compaction Test in accordance with ASTM D 1557.
  - d) Particle size analysis in accordance with ASTM D 422 (sieve only)
  - e) Plasticity index in accordance with ASTM D 4318
2. Submit the name of each material supplier and specific type and source of each material. Any change in source or soil type throughout the job requires approval of the Construction Manager and the Engineer. Submit certifications and test results for proposed materials as described below.

**I. Certification:**

1. Imported fill shall be free of all hazardous substances as listed by the New Jersey Department of Environmental Protection in New Jersey Administrative Code, Title 7; Chapter 1E, Appendix A. Contractor shall submit certification of compliance and test results substantiating compliance to the Construction Manager by the Contractor not less than 2 weeks prior to its intended use.
2. Before proceeding with work, Contractor shall submit a certification in an acceptable form, stating that careful examination has been made of the site, existing structures, existing adjacent structures, records of utility lines, test boring records, soil samples, subsurface exploration reports, the drawings, and all other contract documents.

**J. Catalog Cuts:**

1. Submit catalog cuts and manufacturer's literature for the equipment to be used for compaction and proof rolling. Static drum weight shall be provided for the proof rolling equipment.

**K. Shop Drawings:**

1. The Contractor shall submit a shop drawing showing the procedures, layout and the limits of the proposed excavation for review by the Geotechnical Engineer.
2. The Contractor shall submit drawings and calculations for his proposed temporary excavation support system and construction dewatering system for review by the Geotechnical Engineer. Submittals shall be prepared, signed and sealed by a professional engineer licensed in the State of New Jersey.
3. The Contractor shall submit drawings for his proposed protection plan of adjacent structures. Submittal shall be prepared, signed and sealed by a professional engineer. The contractor shall submit his lateral and vertical movement monitoring plan during construction for review. Submittal shall be prepared, signed and sealed by a land surveyor licensed in the State of New Jersey.

4. The contractor shall submit drawings and calculations for permanent retaining walls (mafia block, boulder, MSE) retaining walls for review by the Geotechnical Engineer, if necessary. Submittal shall be prepared, signed and sealed by a professional engineer licensed in the State of New Jersey.
5. The contractor shall submit his proposed method and procedures (line/channel drilling, hoe-ram, blasting etc.) for soil and rock excavations for review by the Geotechnical Engineer. Submit details and permits for rock blasting, if applicable.
6. The Contractor shall submit a shop drawing showing the layout, slopes and details of the perimeter drainage system for review and approval.

L. Environmental testing and sampling:

1. Contractor shall submit sampling and testing results of the soils excavated from the site, which are to be legally disposed of off-site.

1.07 EXISTING CONDITIONS

- A. The project site is located within the north portion of the WPU campus in a tiered parking area. The site is bound by University Drive to the north and east, the existing recreation center building to the south and Mills Drive to the west. Century and Skyline Halls are to the southwest of the site and a soccer field is to the south of the existing recreation center. A steep drop off with an existing brook is located to the southeast and east of the site.
- B. Contractor shall visit the site, read geotechnical engineering reports and shall familiarize himself with the existing project conditions prior to bidding.
- C. Subsurface conditions reported in the geotechnical engineering reports and memorandums are not intended as representations or warranties of accuracy or continuity between soil borings or test pits. It is expressly understood that the Owner will not be responsible for interpretations or conclusions drawn therefrom by Contractor. Data are made available for convenience of Contractor. Additional test borings and other exploratory operations may be made by Contractor at no cost to the Owner.
- D. The anticipated top of competent natural soils and rock elevations given in the geotechnical report and contract documents are approximate and shall be verified in the field by the Contractor and the Owner's Geotechnical Engineer. Footing subgrades shall be inspected and approved by a qualified geotechnical engineer.

1.08 ERRORS IN DEPTH

- A. In the event that any part of the excavation be carried, through error, beyond the depth and the dimensions indicated on the drawings or called for in the specifications, then the Contractor, at own expense, shall furnish and install gravel, stone, suitable backfill with which to fill to the required level, in all locations except beneath footings, in accordance with the Backfilling and Compaction Section below. At footing locations, Contractor shall be required to fill over-excavations to level of bottom of footing with concrete having a 28-day compressive strength not less than 3,000 psi at no additional cost to the Owner.

**1.09 ENVIRONMENTAL CONSIDERATIONS**

- A. Install erosion control measures in the sequence shown on the Contract Drawings or as directed by the Engineer or regulatory agencies to protect adjacent properties and water resources from erosion and sediment damage.
- B. Certification that imported fill materials are free of all contaminants above non-restricted use standards, as defined by NJDEP, will be required.
- C. Contractor shall read the environmental assessment reports (if available) and shall familiarize himself with the existing environmental conditions. Environmental issues shall be handled in accordance with environmental specifications, if any.
- D. Contractor shall perform environmental sampling and laboratory testing for the soils excavated from the site and to be disposed legally off-site. Sampling and testing shall be in accordance with the NJDEP requirements and as per disposal facility requirements.
- E. Excess materials (soil and/or geotechnically unsuitable materials) that are not re-used on site shall be disposed of in accordance with all applicable regulations. All fees associated with this activity (e.g. sorting co-mingled materials, load-out, transportation, disposal sampling, permits, etc.) are the responsibility of the Contractor.
- F. Contractor shall coordinate with all receiving facilities and shall be responsible for performing all testing to ensure soil and other materials are in compliance with receiving facilities criteria.
- G. Pumping groundwater off the site shall be in accordance with the applicable local and federal regulations. Contractor shall obtain necessary permits to pump the water off the site.

**1.10 QUALIFICATIONS**

- A. Contractor for Work of this Section shall specialize in performing earthwork operations of the magnitude of this project with a minimum of five (5) years of satisfactory experience.

**1.11 PROJECT RECORD DOCUMENTS**

- A. Accurately record and promptly inform Owner and Geotechnical Engineer of actual locations of all subsurface utilities, structures, and obstructions encountered.
- B. Accurately record any as-built variation from the construction plans and specifications. Contractor shall provide as-built drawings within 30 days of project completion.

**PART 2 – PRODUCTS**

**2.01 MATERIALS**

- A. Soil and rock materials generated by excavation procedures, and utilized to complete the work as specified herein, shall comply with the specific requirements associated with these materials as they are listed below. The constituents and proportions given are to be verified by the Owner's Geotechnical Engineer prior to fill placement. To obtain the specified

material gradations, the Contractor may utilize on-site crushing methods. Any variations to the gradations described below shall be subject to the prior review and approval by the Owner's Geotechnical Engineer.

**B. On-Site Fill:**

1. On-site borrow shall consist of those materials previously excavated from on-site excavation areas judged to be suitable by the Engineer. Usable on-site materials shall consist of clean soils free of wood, metal, organic and other deleterious materials and shall meet the gradation requirements for structural and non-structural fill given below. Recycling of on-site concrete demolition debris is encouraged. Crushing of excavated rock is encouraged. The excavations will generate excess materials (soil and rock). The most of the on-site soils contain higher fine soil particles (silt, clay) content and is expected not to meet the gradation criteria for structural fill. On-site soils and rock can be processed (screening, crushing, mixing, aeration, moisture conditioning, etc.) for reuse as structural fill.

**C. Off-Site Imported Fill**

1. Off-site common borrow shall consist of inorganic soil free of wood, metal, etc. and shall meet the required structural fill gradation requirements given in the sections below. The Contractor shall notify the Engineer of the proposed borrow area and shall deliver a minimum 25 lb sample of the soil to the project site at least 1 week prior to use of material to permit inspection and testing of the material to establish field density criteria. The borrow material shall have a water content such that adequate compaction can be achieved.

**D. Structural Fill**

1. Approved off-site fill meeting the following gradation requirements:

<u>Sieve Size</u>	<u>Percent</u>
<u>Passing 4 inches</u>	100
¾ inch	70 – 100
No. 4	30 – 80
No. 50	10 – 35
No. 200	5 – 15

On-site fill meeting the above given criteria can also be used as structural fill. The amount of material passing No.200 sieve can be up to 30% for on-site soils and the maximum particle size can be up to 8 inches. Structural fill shall be used in areas to receive slabs, pavement and utilities.

For areas behind below-grade walls and behind retaining walls, structural fill shall contain 15% or less passing No. 200 sieve.

**E. Non-Structural Fill**

1. Approved on-site or off-site fill free of hazardous and deleterious materials. Non structural fill shall not contain any particle larger than the lift thickness or 6 inches whichever is less. Non-structural fill shall be used only in landscape areas.
- F. Drainage Fill, Crushed Stone Layer or Bedding Layer
1. Drainage or Crushed Stone fill or bedding layer shall be clean evenly graded mixture of crushed stone, or crushed or uncrushed gravel known in the industry as  $\frac{3}{4}$ - inch crushed stone meeting ASTM D448, coarse aggregate grading size 57. Recycled concrete aggregate shall not be acceptable.
- G. Soil Materials Availability
1. Provide approved borrow soil materials from off- site when sufficient approved soil materials are not available from excavations.
- H. Drainage Composite
1. Vertical composite drainage mat shall be Miradrain 6000 or approved equal.
- I. Filter Fabric:
1. Mirafi 140N, or approved equal.
- J. Drainage Pipe
1. 4-inch-diameter, perforated, schedule 40 PVC pipe and shall be embedded in a 6-inch thick layer of clean crushed stone wrapped in filter fabric. Crushed stone shall meet the requirements of AASTO No.57.
- K. Plastic Vapor Barrier
1. The plastic sheet vapor barrier shall not be less than 15-mil-thick and shall conform to ASTM E 1745 Class A requirements.
- L. Waterproofing Membrane for Below-Grade Walls
1. Preprufe 160 R Plus manufactured by GCP, or equivalent
- M. Dense-Graded Aggregate
1. Dense Graded Aggregate (DGA) shall be mixture of crushed stone and shall meet the composition and gradation requirements of NJDOT DGA requirements.

## 2.02 EQUIPMENT

- A. Compactor – Minimum 5-ton static drum weight vibratory smooth drum and sheeps-foot rollers as approved by Owner’s Engineer.
- B. Compactor – Wacker RT 82-SC (or equivalent, as approved by Owner’s Engineer) articulated walk-behind vibratory trench roller for areas where access or maneuverability is limited.

- C. Compactor – Wacker BS500 (or equivalent, as approved by Owner’s Engineer) jumping jack compactor for backfilling of very narrow trenches.
- D. Proofrolling Compactor (Soil Subgrade Areas, where specified): Proofrolling vibratory compactor shall have a static drum weight of at least 5 tons. For cohesive soils use sheeps-foot or padded surface compactors. No heavy proofrolling within 7 feet lateral distance of a wall or below-grade structure/utility
- E. Proofrolling Dump-Truck (soil subgrade, where specified): A fully loaded tri-axle dump truck with a static weight no less than 20 tons. No heavy proofrolling within 10 feet lateral distance of a wall or below-grade structure/utility
- F. Rock excavation equipment, such as hoe-rams, splitters, or other mechanical equipment as required.
- G. Lightweight construction equipment for grading proposed lawn areas.
- H. All equipment and tools required to perform the work. All equipment and tools shall be in perfect operating conditions.
- I. Excavator: Caterpillar CAT 349F hydraulic excavator which shall have a minimum 396 hp net flywheel power and shall be equipped with hardened rock teeth.
- J. Transport off-site materials to project using well-maintained and operating vehicles. Once on site, transporting vehicles shall stay on designated haul roads and shall at no time endanger improvements by rutting, overloading, or pumping.

### **PART 3 – EXECUTION**

#### **3.01 PRE-CONSTRUCTION MEETING**

- A. Before commencing work of this Section, meet with representatives of governing authorities, Owner, Geotechnical Engineer, Site Contractor, Demolition Contractor, and other concerned entities. Review the earthwork procedures and responsibilities including testing and inspection procedures and requirements. Notify participants at least three (3) working days prior to convening the conference. Record discussions and agreements and furnish a copy to each participant.

#### **3.02 GENERAL**

- A. Identify required lines, levels, contours and datum to bring site grades to the proposed subgrade conditions inferred from the drawings.
- B. Do not allow the Work of this section to be performed or installed without necessary inspections, tests and approvals.
- C. By submitting its bid, Contractor represents that it has reviewed the information provided and investigated the Site to determine type, quantity, quality, and character of excavation Work to be performed. Contractor shall become thoroughly familiar with the available geotechnical information, as well as the Site, site conditions, and all portions of the Work falling within this Section.

- D. Contact NJ One Call at 811 or (800) 272-1000 and local utility companies in a suitable timeframe before excavation begins to accommodate the respective utility company's response time to provide mark-outs where needed.
- E. Where existing grades are above proposed subgrade elevation, excavate materials to the lines and grades shown on the Contract Drawings. The Work covered under this Section shall include excavation for shallow foundations.
- F. Perform excavation using capable, well maintained equipment and methods acceptable to Owner and governing agencies.
- G. Blasting of rock shall not be permitted.
- H. Material with deviations from the above requirements may be used as suitable fill if acceptable to Owner's Engineer; Engineer will be the sole judge of the suitability of all materials, whether from on-site excavations or off-site sources.
- I. When performing grading operations during periods of prolonged wet or dry weather, provide adequate measures for surface drainage and groundwater control, and moisture control of soils (i.e., wetting or drying by discing) so as to place and compact the soil at a moisture content within a few percentage points of the material's optimum water content. Any disturbed areas shall be sealed using a smooth drum roller at the end of each day.
- J. Shoring, bracing, and fencing shall be installed in accordance with Federal OSHA requirements as well as the requirements of all State and Local authorities having jurisdiction.
- K. Protect persons and property from damage and discomfort caused by dust. Water as necessary to quell dust. Contractor shall ensure that no sidewalks and roadways will have any issue with icing when water spraying is used during freezing temperatures.
- L. All underground installation of pipes, conduit, etc. in the area to be paved shall be completed prior to placement of any asphalt or concrete paving.
- M. Allow no debris to accumulate on-site. Haul debris away from the site and dispose of at no cost to the Owner.
- N. Excess on-site soils shall be disposed of off-site in accordance with the applicable regulations at no cost to the Owner.
- O. Contaminated on-site soils, if any, shall be disposed of off-site in accordance with the applicable regulations at no cost to the Owner.

### 3.03 PREPARATION

- A. Prior to all work of this section, the Contractor shall become thoroughly familiar with the geotechnical engineering studies as well as the site, site conditions, and all portions of the work falling within this section.
- B. The Contractor shall refer to the soil erosion and sediment control plans for staging of earthwork operations and for erosion control measures to be implemented prior to commencement of earthwork.

- C. Locate and identify existing utilities that are to remain and protect them from damage. Notify utility companies to allow removal and/or relocation of any utilities that are in conflict with the proposed improvements.
- D. Protect fences, structures, sidewalks, paving, curbs, etc. to remain from equipment and vehicular traffic.
- E. Protect benchmarks, property corners and all other survey monuments from damage or displacement. If a marker needs to be removed/relocated it shall be referenced by a licensed land surveyor and replaced, as necessary, by the same at no additional cost to the Owner.
- F. Remove from the site, material encountered in earthwork and grading operations that, in the opinion of the Owner or Engineer, is unsuitable or undesirable for backfilling in subgrade or foundation areas as per Part 2 of these specifications.
- G. Contractor shall perform environmental sampling and laboratory testing for the soils excavated from the site and to be disposed legally off-site. Sampling and testing shall be in accordance with the NJDEP requirements and as per disposal facility requirements.

#### 3.04 CLEARING, GRUBBING AND STRIPPING

- A. Thoroughly clear and grub any surface debris, vegetation, trees (including removal of any associated roots systems), brush, etc. from the future building pad and pavement areas, along the alignment of proposed retaining walls, and any other areas to receive new fill. Cleared and grubbed materials shall be properly disposed of in accordance with all applicable codes and ordinances.
- B. Strip any topsoil from the ancillary structures, pavement, and retaining wall areas. Excess stripped materials shall be disposed of in accordance with all applicable codes and ordinances.
- C. Strip asphalt within the building and ancillary structure footprint area and 10 ft beyond, and from any areas to receive new fill. Removed asphalt can be milled by the Contractor and asphalt millings can be re-used as subbase material beneath new pavements. Asphalt to be used as recycled material shall be milled to form a well-graded material having a maximum particle size of 2-inches. The Contractor shall provide dust control measures during any milling process. Excess asphalt materials shall be properly disposed of in accordance with all applicable codes and ordinances.
- D. Perform all site demolition and clearing work, including removal of existing concrete structures and foundation systems associated with previous structures. All excavations and/or below-grade removals during the demolition phase shall be properly backfilled in accordance with this Section. This work shall be performed immediately following below-grade removal.
- E. Allow no debris to accumulate on-site. Haul debris away from the Site and dispose of at no cost to Owner.
- F. Any abandoned structures or utilities encountered during excavation shall be removed and disposed of, or abandoned in-place by complete filling with grout or sand, subject to review and approval by Owner's Engineer on a case-by-case basis.

- G. Stockpile excess soil on-site, at the location designated on the Contract Drawings.

3.05 PROTECTION OF EXISTING ADJACENT STRUCTURES, UTILITIES AND ROADWAYS

- A. Construction activities such as excavation and rock chipping with hydraulic hammers may affect the surrounding structures, if not adequately protected and monitored during construction.
  - B. The work area is adjacent to the existing buildings, structures and utilities to remain. The Contractor shall be responsible for repairing all construction related damages to the satisfaction of the damaged property owners at Contractor's expense.
  - C. The work shall be executed so that no damage or injury will occur to the existing public, adjoining, adjacent structures, streets or utilities. Should any damage or injury caused by the Contractor or anyone in Contractor's employ or by work under this Contract occur, the Contractor shall, at own expense, repair such damage and shall assume all responsibility for such injury and damage.
  - D. Excavation sides and adjacent structures, foundations, streets and utilities shall be protected by means of adequate bracing, shoring and sloping, at all times. No excavation shall be carried below adjacent existing foundations or utilities unless adequate measures designed by a Professional Engineer are taken to protect adjacent structures and utilities.
  - E. Obtain all required permits and perform all construction work in a safe manner in accordance with applicable codes and regulations. Owner shall not entertain any delays to project delivery date due to delays in permit procurement by the contractor.
  - F. Prior to commencement of any Work, consult the records for existing structures and utilities and note all conditions and limitations which might affect the Work required under this Section. Notify utility locator service for area where the project is located prior to excavation and earthwork. Any damage to utilities, permanent or temporary structures, and trees, slopes, and vegetated areas designated to remain undisturbed, as a result of Contractor's procedures/operation shall be Contractor's sole responsibility, and shall be immediately reported to Owner and respective utility Owner(s).
  - G. Provide barricades, warning lights, and barriers to prevent accidents, to avoid all necessary hazards and protect the public, the Work, and the property at all times, including Saturdays, Sundays and Holidays. Minimize interference of vehicular and pedestrian traffic with adjoining roads, streets, walks, and other adjacent occupied or used facilities during all operations. Protect fences, structures, sidewalks, paving, curbs, etc. to remain from equipment and vehicular traffic.
- 1. Dust and Dirt Control:
    - a) Use all means necessary to control dust on or near Work.
    - b) Thoroughly moisten all surfaces as required to prevent dust being a nuisance to the public, neighbors and performance of other Work on the Site.
  - H. Provide vehicle wheel cleaning to prevent tracking of soil, dirt, etc., onto public streets and in parking and access drive areas.

- I. Contractor shall be solely responsible for safety at the Site as it relates to earthwork operations.

3.06 MONITORING OF ADJACENT STRUCTURES, STREETS, SIDEWALKS AND UTILITIES

- A. Monitoring (displacement, vibration) of the relevant buildings, structures sidewalks and streets shall be performed per Section 310913.

3.07 PRE-CONSTRUCTION CONDITIONS DOCUMENTATION

- A. A pre-construction conditions documentation of the relevant buildings, structures sidewalks and streets shall be performed per Section 310913.

3.08 EXCAVATION AND DISPOSAL

- A. The subsurface conditions of the site consist of fill layer overlying natural sandy soils with underlain by rock strata. The overburden soils contain large boulders and cobbles. The excavation shall be unclassified and shall comprise and include the satisfactory removal and legal disposal of all materials encountered regardless of the nature of the materials and shall be understood to include rock, boulders, cobbles earth, hardpan, miscellaneous fill, foundations, structures, slabs, walls, utilities, pavements, curbs, piping and debris.
- B. Excavation shall be performed in a safe manner in accordance with the applicable regulations. Shoring, bracing shall be used where necessary.
- C. Rock Excavation, if encountered, - Significant rock excavation in rock to reach design levels is not anticipated. Rock excavation will require the use of hydraulic hoe-rams, splitters and excavators fitted with special ripping teeth. Line and channel drilling can be performed to ease excavation by creating artificial fractures in the rock mass.
- D. All excavation shall extend to the depths of the form and size required for the installation of the work as indicated on the Drawings. When excavations for foundations have reached the required depths, project Geotechnical Engineer shall make an inspection of the conditions.
- E. The materials excavated shall be separated during excavation. Unsuitable materials shall be defined as unsuitable for reuse as structural fill, and as soils having an excess of wood, metal, other objectionable material, saturated material and organic soil. Materials that, in the opinion of the Owner's Geotechnical Engineer, are not suitable for fill; any surplus earth and all rock shall be removed from the site and legally disposed of off-site at no cost to the owner.
- F. Graded areas outside the building area shall be excavated/filled to within 4 inches of final grades in landscaped areas and to within 0.1 foot of final subgrade within paved areas as shown on the plans.
- G. Excess on-site soils shall be disposed of off-site in accordance with the applicable regulations at no cost to the Owner.
- H. Contaminated on-site soils, if any, shall be disposed of off-site in accordance with the applicable regulations at no cost to the Owner.

3.09 REMOVAL OF REMNANTS OF DEMOLISHED STRUCTURES

- A. Any existing buried structure (i.e. foundations, slabs, walls, tanks, utilities, pits, solar panel) below the proposed foundations and slabs shall be removed completely.

- B. No utility line or pipe (operational or abandoned) shall be left beneath the proposed foundations and slabs. Any existing buried abandoned rigid structure beneath the proposed slabs shall be removed at least 3 feet below the bottom of the proposed slabs to prevent rigid spots. No void or pit shall be left beneath the proposed slabs or foundations.

### 3.10 STORAGE OF SOIL MATERIALS

- A. Stockpile excavated materials acceptable for backfill and fill soil materials, including acceptable borrow materials. Stockpile soil materials without intermixing. Place, grade, and shape stockpiles to drain surface water. Cover to prevent wind blown dust and to prevent moisture susceptible soils from becoming saturated, and therefore, unsuitable for reuse. Stockpile soil materials away from edge of excavations. Do not store within drip line of remaining trees.
- B. Contractor shall be solely responsible for the stability of stockpiles and the areas where stockpiles are placed. Contractor shall stockpile materials in a manner so as not to compromise the stability or cause damage to or loss of support to existing structures, surfaces, and embankments.

### 3.11 SHORING, BRACING, STABILIZATION, UNDERPINNING

- A. The proposed construction requires excavations along the property lines, and adjacent to structures, foundations, utilities and streets.
- B. Provide and install temporary excavation support, shoring, bracing, and fencing and such other protection as required to ensure against any damage to existing roadways, pavement, other structures, and utilities when excavation Work occurs adjacent to or below same. Shoring and bracing shall be installed in accordance with Section 315000 – Temporary Excavation Support and Underpinning and in accordance with Federal OSHA requirements as well as the requirements of all State and Local authorities having jurisdiction.
- C. The Contractor shall utilize all appropriate methods to shore, brace and stabilize excavations and cuts in accordance with OSHA regulations, Building Code and Contract Documents. In case of conflict, the most stringent shall apply.
- D. Inspect the site, examine existing conditions and make all necessary preparations for the safe and proper sequence of work. Properly guard and protect excavations so as to prevent them from becoming dangerous to person or property.
- E. Properly slope sides of excavation or provide shoring, sheeting and bracing to prevent caving, erosion, or gulying of sides of excavations.
- F. Brace, shore and protect existing structures, foundations, streets, and utilities when excavations are made adjacent to the existing structures, streets, utilities or within a distance that they will be affected by the excavation. Underpin adjacent structures if excavations are to be carried to a depth below the foundations of the adjacent structure and adjacent foundations.
- G. Existing Building Foundations – Do not excavate below the adjacent building/structure foundations unless adequate shoring measures are taken. If required, underpin the existing building foundations prior to proceeding with the excavations extending below the base of adjacent foundations.
- H. All temporary excavation support systems and underpinning shall be designed by a Professional Engineer retained by the Contractor. Submit temporary support and underpinning calculations and drawings for review by the Engineer.

- I. Maintain sides and slope of excavation in safe condition until backfilling or other work is complete. Maintain shoring and bracing in place until completion of work.
- J. Provide materials for work in good serviceable order.
- K. All shoring, bracing, and stabilization etc. is to be removed upon completion of the work where they are installed, including any portion thereof, outside of street and lot lines. Within the lot, remove all wood and cut steel elements to a minimum of 4 feet below grade. Where they interfere with new work and utilities, remove in their entirety.
- L. Install appropriate temporary excavation support systems as required. All sheeting, shoring and underpinning shall be designed and inspected by a professional engineer retained and paid by the Contractor.
- M. Establish vertical and lateral control points on temporary excavation support system to monitor movements during construction. Points shall be monitored once a week by a licensed surveyor. Submit results to the geotechnical engineer for review and directions.
- N. All rock cuts shall be inspected by a qualified geotechnical engineer retained by the contractor. The engineer shall determine stabilization methods. Stabilization for cuts may consist of anchors, bolts, netting and benching.
- O. Bench, step and slope excavations in accordance with OSHA regulations. Use rakers, soldier piles, lagging, trench box, etc to support the cuts, where necessary. Implement of all required safety measures to prevent damage to adjacent structures and public. Do not excavate below adjacent building foundations unless adequate shoring measures are taken.
- P. No excavation shall be carried out below adjacent existing foundations or utilities unless adequate measures (underpinning and/or shoring) designed by a Professional Engineer licensed in the state of New Jersey are taken.
- Q. Along the property lines, the contractor shall design and install adequate shoring system acceptable to Owner and geotechnical engineer. Obtain the required permits for shoring and construction from Owner.

### 3.12 DEWATERING

- A. Contractor shall utilize appropriate dewatering equipment and methods as necessary to perform the required work (excavation, preparation, proofrolling, backfilling, concreting, utility installation etc) in a dry environment. The contractor shall be responsible to maintain the work area dry at all times.
- B. Contractor shall remove all groundwater and surface water from the work areas. Maintain groundwater level at least 2 feet below the work areas, below the foundation/slab subgrades and below the invert of utilities until such time that work is complete.
- C. Contractor shall supply necessary equipment (wells, pumps and crushed stone, etc.) to maintain the work area dry at all times.
- D. Water collected shall be removed legally before any fill is placed or concrete poured.
- E. Prevent surface water and subsurface or groundwater from entering excavations, from ponding on prepared subgrades, and from flooding project site and surrounding area. Protect subgrades and foundation soils from softening and damage by rain or water accumulation. Maintain water level at least 2 feet below the foundation and slab subgrades.

- F. No pipe, concrete or bedding shall be placed in water unless specific approval is obtained from the Engineer.
- G. Water removed from an excavation shall be disposed of in such a manner as to avoid interference with vehicular or pedestrian traffic and to prevent damage to adjacent property or construction. Discharge directly into manholes or existing pipes will not be permitted unless approved by the Engineer or appropriate local authority. It shall be the Contractor's responsibility to discharge the water in such a manner that mud and silt are not discharged into the existing system, to remove from such facilities any mud, silt, and debris which has accumulated and to leave the drainage facility in a condition similar to that which existed prior to his operations.
- H. Pumping groundwater off the site shall be in accordance with the applicable local and federal regulations. Contractor shall obtain the necessary permits to pump the water off the site.
- I. It is the Contractor's responsibility to provide adequate dewatering of the site by means and methods approved by the Owner's Engineer, if groundwater is encountered during the earthwork activities. Dewatering shall be in accordance with these specifications. The Contractor shall review the Geotechnical Reports to obtain information regarding the depth of groundwater on-site.

### 3.13 FOUNDATION SUBGRADE PREPARATION

- A. All foundations for buildings and structures (i.e. spread, combined and continuous footings) subgrade preparation shall be accomplished as follows or as directed by the Geotechnical Engineer:
  - 1. Locate and mark in the field the limits of the proposed foundations. Perform dewatering as needed. Provide sufficient safe slope or shoring and bracing measures to prevent collapses and cave-ins. Underpin existing foundations where required.
  - 2. Bearing Material: Foundations shall bear directly on natural dense, undisturbed, sandy soils or rock (where encountered at shallow depths) which can support an allowable bearing pressure provided in the Contract Documents.

Foundations to bear on soil subgrade can alternatively be supported on approved materials (compacted structural fill, lean concrete or  $\frac{3}{4}$  inch crushed stone) placed directly over competent, natural bearing materials (dense sandy soils).

Foundations to bear on rock subgrade can alternatively be supported on lean concrete (minimum 4,000 psi) placed directly over properly prepared rock subgrade, only.

The inspecting geotechnical engineer shall have the sole authority to determine the suitable bearing strata.

- 3. Unsuitable bearing materials (existing fill, loose/soft soils, obstructions, and remnants, where encountered) shall be removed to reach the suitable natural competent bearing subgrade. The influence zone is defined as a 1H on 2V theoretical line drawn downward from the edge of the proposed foundation. This will require excavations which shall be sloped / shored appropriately. Over-excavations can be filled with the approved materials to reach the design levels or foundations can be constructed at lower elevations with piers extending to the

design levels if approved by Structural Engineer.

4. Variations: The anticipated competent bearing strata elevations noted in the contract documents are approximate and vary across the site. Contractor shall assume in his bid that suitable natural bearing soils and rock may be 2 feet lower or higher than shown on contract documents. Contractor shall perform all related work (excavation, shoring, dewatering, backfilling, improvement etc.) to remove all unsuitable materials below the foundations to reach competent natural bearing materials at no additional cost to the Owner.
5. Inspection: Foundation subgrades shall be inspected and approved by a qualified geotechnical engineer who shall verify the allowable bearing capacity of the subgrade provided in the Contract Documents. No foundation shall be constructed without approval of the subgrade by the inspecting geotechnical engineer.
6. Soil Subgrade Preparation: Remove all unsuitable materials including any soft or disturbed natural soils until competent natural soils are encountered. Perform excavation for the final 6 inches using a flat bucket (bucket with no teeth) to minimize the disturbance of the anticipated natural subgrade. If natural soil at the bearing elevation becomes loosened or disturbed during excavation, it shall be removed or compacted utilizing a vibrating plate compactor (backhoe attachment).
7. Rock Subgrade Preparation: If rock is encountered, refer to the rock excavation section of this specification. Following the rock excavation, the rock subgrade shall be cleaned to remove all loose rock pieces and debris. Rock subgrades shall be flat and shall not have a slope exceeding 10 degrees from horizontal.
8. Buried Elements: No pipes, utilities or remnants (foundations, slabs, walls, etc.) shall be left beneath the proposed foundations.
9. Subgrade Protection: Foundation subgrades shall be protected against moisture and frost prior to placing concrete. Foundation bearing surfaces shall be level and clear of debris, standing or frozen water and other deleterious materials, and shall be protected against frost. Exposed subgrades shall be protected against weather and run-off water. Water shall not be allowed to pond and sit over the subgrades. Appropriate measures shall be taken to prevent disturbance of the subgrade. Once the suitable bearing stratum is encountered, the subgrades shall be compacted with a vibratory plate compactor having a static weight of not less than 0.5 ton. Any areas exhibiting evidence of inadequate bearing capacity shall be removed to competent material.
10. Protective mud mat: The inspected and approved subgrades shall be sealed with a thin lean concrete layer (2-inch-thick mud mat) until the footings are cast for protection against weather effects. The lean concrete shall have a 28-day compressive strength not less than 3,000 psi. Excavation sides shall be maintained sufficiently stable to prevent cave-ins during placement of the lean concrete. Once the lean concrete is sufficiently cured, construct the foundations over the lean concrete at conventional depths in accordance with the contract documents.
11. Foundations Near Existing Structure or Utilities (existing or proposed): Some of the proposed foundations will be immediately adjacent to the existing recreation

center structure to remain and utilities (existing or proposed). Foundations adjacent and near the existing below-grade walls/foundations shall be lowered and constructed at the same level as the existing foundations and utilities as per structural drawings to avoid inducing load on existing structures/foundations.

12. Once the excavation is complete and suitable natural bearing subgrade is exposed, the project surveyor should locate the center and edges of the proposed foundation. Verify that the base of the excavation (limits of the exposed subgrade) is at least 1.5 feet wider than the proposed foundation dimensions.
13. Perform dewatering as needed. Provide sufficient safe slope to prevent collapses and cave-ins. Implement of all required safety measures to prevent damage to adjacent structures and public. Do not excavate below adjacent building foundations unless adequate shoring measures are taken.
14. Inspecting geotechnical engineer shall verify that the exposed subgrade can support an allowable bearing pressure provided on the Project Documents and Geotechnical Report.
15. The materials excavated from the foundation locations may be processed for re-use as backfill in other areas of the site.

#### 3.14 BUILDING SLAB SUBGRADEPREPARATION

- A. The building pad (slab-on-grade) subgrade preparation shall be accomplished as follows:
  1. The building area shall include the building footprint plus a minimum of 5 feet beyond the building limits or as defined by the Geotechnical Engineering Report, whichever is more stringent.
  2. Slabs-on-grade shall bear on natural soil, compacted structural fill. Subgrades shall be improved and shall be inspected by a qualified Geotechnical Engineer.
  3. Remove all materials to reach design elevations and as determined by the Geotechnical Engineer. In fill areas, all surficial materials (topsoil etc.) shall be removed.
  4. Any existing below-grade rigid obstructions such as concrete, boulders, debris etc. shall be removed at least 3 feet below the base of the proposed slabs.
  5. Upon completion of the required excavations, the exposed subgrades shall then be proofrolled. In fill areas place structural fill in lifts over the proofrolled subgrade and compact each lift. Backfilling, compaction and proofrolling shall be in accordance with Part 3 of these specifications. The fill materials gradation shall meet the requirements given in Part 2 of these specifications. Properly processed excavated materials may be utilized for backfilling
  6. Once the design elevations are reached, place the specified bedding layer over the improved subgrade to serve as bedding and capillary break layer immediately beneath the building slab. The bedding/capillary break layer shall consist of a minimum 6-inch thick layer of 3/4-inch crushed stone. Install also the

specified plastic sheet vapor barrier beneath the slab at the position shown on the Structural Drawings.

7. On-site soils contain varying amounts of silt which are sensitive to moisture and are hard to work with when saturated. Protect the subgrades against the effects of weather and equipment. Appropriate surface drainage and protection methods such as trenching, sloping, and pumping should be implemented to maintain the subgrades in a dry and workable condition at all times.
8. Upon completion of building pad preparation, the Contractor shall provide a sealed survey of the building pad elevation on a 50-foot grid to the Engineer and Owner for approval.

### 3.15 PAVEMENT AND PAD SUBGRADE PREPARATION

A. Pavement and pad subgrades shall be accomplished as follows:

1. Pavement shall bear on improved existing fill, natural soils or rock, or import granular fill. Subgrades shall be inspected by a qualified Geotechnical Engineer.
2. Remove all surficial material (topsoil, asphalt, etc.) and proofroll the exposed subgrade (soil subgrades only) that is to receive pavements in accordance with the requirements of Proofrolling section given below.
3. If rock is encountered, refer to the rock excavation section of this specification.
4. In fill areas, structural fill shall be placed in lifts over the proofrolled subgrade and shall be compacted. The fill materials gradation shall meet the requirements given in Part 2 of these specifications. Placement and compaction of fill shall be in accordance with the requirements given below in the Backfilling and Compaction section.
5. Protect the subgrades against the effects of weather and equipment. Appropriate surface drainage and protection methods such as trenching, sloping, and pumping should be implemented to maintain the subgrades in a dry and workable condition at all times.

### 3.16 LAWN AREA SUBGRADE PREPARATION

A. Lawn area subgrade preparation shall be accomplished as follows:

1. In fill areas, excavate all topsoil. Excavate natural and/or fill materials down to subgrade elevation and stockpile on-site. The fill materials gradation shall meet the requirements given in Part 2 of these specifications. Placement and compaction of fill shall be in accordance with the requirements given below in the Backfilling and Compaction section.
2. In cut areas, remove all material to the proposed elevation provided on the Contract Documents.

### 3.17 RETAINING WALL SUBGRADE PREPARATION

- A. Retaining walls subgrade preparation shall be accomplished as follows:
1. Walls shall bear on suitable natural soils or imported granular fill over suitable natural soil or rock with an allowable bearing pressure as specified on the Contract Documents or Manufacturers Recommendations.
  2. Remove all surficial material (topsoil, asphalt, etc.) and proofroll the exposed subgrade that is to receive pavements in accordance with the requirements of Proofrolling section given below.
  3. If rock is encountered, refer to the rock excavation section of this specification.
  4. In fill areas, structural fill shall be placed in lifts over the proofrolled subgrade and shall be compacted. The fill materials gradation shall meet the requirements given in Part 2 of these specifications or in accordance with the manufacturer's recommendations, the more stringent shall apply. Placement and compaction of fill shall be in accordance with the requirements given below in the Backfilling and Compaction section.
  5. Protect the subgrades against the effects of weather and equipment. Appropriate surface drainage and protection methods such as trenching, sloping, and pumping should be implemented to maintain the subgrades in a dry and workable condition at all times.

### 3.18 PROOFROLLING

- A. The work shall consist of proofrolling of all excavated soil subgrades for slabs, pavements and roadways.
1. Proofroll the subgrade with a heavy vibratory drum roller having a minimum static weight as specified in Part 2. A minimum of 6 passes shall be carried out over the exposed subgrades.
  2. If any material exhibits instability (i.e. pumping, weaving or rutting) under the action of the roller, the unstable areas should be over-excavated to remove the unstable soil and should be backfilled with compacted clean structural fill. Backfilling and compaction shall be performed in accordance with the requirements of Backfilling and Compaction section below.
  3. The Contractor shall establish operating procedures whereby uniform coverage of an area is obtained and the number of passes of the compaction equipment can be readily determined.

### 3.19 BACKFILLING AND COMPACTION

- A. Backfill excavations promptly, but not before completing the following:
1. Acceptance of construction below finished grade including, where applicable, damp proofing, waterproofing, and perimeter insulation, as specified in Contract Documents.

2. Surveying locations of underground utilities for record documents.
3. Testing, inspecting, and approval of underground utilities.
4. Removing concrete formwork, trash and debris from excavation.
6. Removing temporary shoring, bracing, and sheeting in accordance with the relevant specifications. Any material left in place to minimize damage to existing utilities to remain shall be cut off at least 2 feet below grade.
7. Installing permanent or temporary horizontal bracing on horizontally supported walls.

B. Place and compact the fill as described below:

1. Suitable on-site and/or imported off-site fill shall be placed and compacted as required within site improvement areas. Structural fill shall be used in areas to slabs, pavements, utilities and behind below-grade walls. Non- structural fill shall be used only in landscape areas. Drainage fill shall be used where specified in the Contract Documents.
2. Fill placed between existing subgrade and slabs, pavements and lawn subgrade areas shall be placed in loose lifts not exceeding 12 inches in thickness and should be compacted with a heavy vibratory plate compactor or roller. Correspondingly, thinner loose lifts should be used in areas where smaller compaction equipment must be utilized due to restricted access.
3. No fill shall be placed in standing water. Any seepage or ponding of water shall be pumped from the excavation prior to placement of fill. No fill shall be placed on frozen ground.
4. Each lift of fill placed for foundation, building slab and pavement support, shall be compacted to a minimum dry density equal to 95% of the maximum dry density as determined by ASTM D1557 (Modified Proctor Test). If the water content of the fill is such that proper compaction cannot be achieved, water shall be added or the soil dried in order to obtain a water content at which the required compaction can be achieved. Fill placed for lawn area subgrade shall be compacted to 90% of the maximum dry density.
5. The Contractor shall establish operating procedures whereby uniform coverage of an area is achieved and the number of passes of the compaction equipment can be readily determined. At the completion of the day's work, the fill surface shall be sealed with the roller.
6. No frozen material shall be used as fill. If the fill material which has been compacted, tested and approved by the Engineer becomes frozen, the Engineer shall be notified and shall determine whether it can remain in place or shall be removed before additional fill can be placed.
7. During rainy weather, the contractor shall take measures to protect fill from becoming saturated. The Contractor shall not place or attempt to compact fill

during rainy weather unless approved by the Geotechnical Engineer. Any water collecting in fill areas shall be removed before further fill placement.

8. After fill work has been completed in a pavement area, the area shall be graded smooth to within 0.1 ft of the final subgrade elevations shown on the Contract Drawings and shall be proofrolled as specified herein.

### 3.20 SHORING, BRACING, CUT STABILIZATION

- A. The Contractor shall utilize all appropriate methods to shore, brace and stabilize excavations and cuts in accordance with OSHA regulations, Building Code and Contract Documents. In case of conflict, the most stringent shall apply. This work shall also be completed in accordance with shoring specifications also.
- B. Contractor shall supply all necessary equipment, labor to perform the work in a safe manner and to protect labor, adjacent structures, utilities, streets and people.
- C. Bench, step and slope excavations in accordance with OSHA regulations. Use rakers, soldier piles, lagging, trench box, etc. to support the cuts, where necessary. Implement of all required safety measures to prevent damage to adjacent structures and public.
- D. All temporary excavation support systems shall be designed by a Professional Engineer retained by the Contractor. Submit temporary support calculations and drawings for review by the Engineer.
- E. Excavation sides and adjacent structures, foundations, streets shall be protected by means of adequate bracing, shoring, sloping at all times.
- F. All temporary excavation support systems shall be designed by a professional engineer retained by the Contractor. Submit temporary support calculations and drawings for review by the Owner's engineer.
- F. Establish vertical and lateral control points on adjacent structures, streets and sidewalks to monitor movements during construction. Points shall be monitored twice a week by a licensed surveyor. Submit results to the geotechnical engineer for review and directions.
- G. All rock cuts shall be inspected by a qualified geotechnical engineer retained by the contractor. The engineer shall determine stabilization methods for cuts. Stabilization for cuts may consist of anchors, bolts, netting and benching.

### 3.21 DEWATERING

- A. The excavations are anticipated to be above the observed groundwater levels but cuts in impervious strata (sandy soils and rock) will collect surficial water seeping down or traveling over the impervious layers.
- B. The Contractor shall utilize appropriate dewatering equipment, tools, gravel sumps and pumps as necessary to remove groundwater, perched water and accumulated water in excavated areas, utility trenches and other excavations until such time that backfilling and the relevant construction is complete.

- C. Contractor shall supply necessary all equipment and labor including but not limited to wells, pumps and crushed stone.
- D. Water collected in fill areas shall be removed by conventional sumps and pumps before any fill is placed.
- E. Prevent surface water and subsurface or ground water from entering excavations, from ponding on prepared subgrades, and from flooding project site and surrounding area. Protect subgrades from softening and damage by rain or water accumulation.
- F. No concrete, formwork, pipe, or bedding shall be placed in water unless specific approval is obtained from the Engineer.
- G. Water removed from an excavation shall be disposed of in such a manner as to avoid interference with vehicular or pedestrian traffic and to prevent damage to adjacent property or construction. All pumping and discharging shall be performed in accordance with local and federal regulations. Contractor shall obtain the required permits and approvals for groundwater discharge from the authorities having jurisdiction. Discharging directly into manholes or existing pipes will not be permitted unless approved by the appropriate local authority and the Owner. It shall be the Contractor's responsibility to discharge the water in such a manner that mud and silt are not discharged into the existing system, to remove from such facilities any mud, silt, and debris which has accumulated and to leave the drainage facility in a condition similar to that which existed prior to his operations.

### 3.22 DRAINAGE MAT

- A. Place vertical drainage mats specified in the contract drawings behind the foundation walls prior to backfilling. Installation shall be in accordance with the manufacturer's recommendations.
- B. Protect the drainage mats during backfilling.
- C. Connect the vertical drainage mats with the perimeter drainage pipe system.

### 3.23 PERIMETER DRAINAGE PIPE

- A. Perimeter drainage pipes shall be installed behind the below-grade wall sections as shown on contract documents. Perimeter drainage pipes shall be installed at elevation indicated on the Contract drawings. The contractor shall prepare a shop drawing showing the layout, slopes and details of the drainage pipe for review by the Geotechnical Engineer.
- B. The perimeter drainage system shall consist of 4-inch diameter, schedule 40, perforated PVC pipes embedded in a 12-inch-thick layer of  $\frac{3}{4}$ -inch clean crushed stone. Recycled concrete aggregate shall not be used in lieu of crushed stone.
- C. A layer of filter fabric such as Mirafi 140NL, or approved equal, shall be wrapped around the crushed stone layer.

### 3.24 WATERPROOFING

- A. Install the specified waterproofing membranes as shown on the contract drawings.

- B. Waterproofing installation shall be installed in strict accordance with the manufacturer's guidelines by qualified installers approved by the manufacturer.
- C. Have a preconstruction meeting with the manufacturer's representative at the site.
- D. Manufacturer's representative shall visit the site at the beginning of the installation and periodically thereafter to verify that the installation is performed to the manufacturer's satisfaction.

### 3.25 FIELD QUALITY CONTROL

#### A. Owner's responsibilities:

- 1. The Owner shall retain a qualified geotechnical engineer to inspect all earthwork operations (subgrade preparation, ground improvement, bearing material determination, backfilling, compaction, proofrolling, drainage system etc).
- 2. Foundation Subgrade: A qualified geotechnical engineer shall inspect and approve all foundation subgrades. No foundation shall be constructed over a subgrade, which was not inspected by the geotechnical engineer. Subgrade preparation and improvement measures shall be performed under supervision of a geotechnical engineer.
- 3. Pavement and Slab Subgrades: A qualified engineer shall inspect and approve the subgrades that will receive pavements and slabs-on-grade. Subgrade preparation and improvement measures, including proofrolling, shall be performed under supervision of a geotechnical engineer.
- 4. In-Situ Density Testing: In-place density testing shall be performed when fill was beneath slabs/pavements, behind walls and in trenches and over utilities. Field in-place density tests where required, shall be performed using a nuclear densometer in accordance with ASTM D 2922. In each compacted backfill layer (lift), perform at least 1 field-in-place density test for each 1,000 sq-ft of slab/pavement area, 100 feet of wall/trench length, but no fewer than 2 tests per lift. When test results indicate that subgrades, fills, or backfills are below specified density, scarify and moisten or aerate, or remove and replace soil to the depth required, re-compact and retest until required density is obtained.
- 5. Drainage Elements: Installation of perimeter drainage pipe, and vertical drainage mats shall be inspected by a qualified geotechnical engineer.
- 6. Waterproofing: Installation of waterproofing shall be inspected by a qualified geotechnical engineer.
- 7. Vibration Monitoring: Vibrations during construction shall be monitored per Section 310913.
- 8. Excavation, shoring and underpinning shall be inspected by a qualified geotechnical engineer.
- 9. Preconstruction Conditions Documentation: The Owner shall retain a professional engineer to perform a pre-construction conditions documentation per Section 310913.

#### B. Contractor's Responsibilities:

1. The Contractor shall retain qualified certified testing agencies, professional engineers and professional land surveyors to perform inspection services not provided by the Owner.
2. Contractor shall retain a professional engineer who shall design and inspect dewatering system, support of excavation (SOE) systems (shoring, bracing, stabilization) and underpinning.
3. Monitoring: Contractor shall retain a licensed surveyor who shall install and monitor lateral and vertical control points on adjacent structures and streets and temporary excavation support systems (i.e. soldier pile and timber lagging) before and during excavation and foundation work.
4. Waterproofing: Installation of waterproofing shall be inspected and certified by the manufacturer's representative retained by the Contractor.
5. Contractor shall be also responsible for retaining qualified professional engineers, certified testing agencies and licensed surveyors to perform required inspections and monitoring not covered by the Owner.

### 3.26 FINISH ELEVATIONS AND LINES

- A. For setting and establishing finish elevations and lines, secure the services of a licensed land surveyor acceptable to the Owner and Owner's Engineer.
- B. Provide elevation grade stakes and any other surveying necessary for the layout of the work. The Contractor shall conduct his work in such a manner that survey stakes will be protected as long as their need exists. Grade stakes which are damaged or stolen shall be replaced by the Contractor's Surveyor at the Contractor's expense.
- C. Graded areas shall be uniform, hard and smooth, free from rock, debris, or irregular surface changes. Finished subgrade surface shall not be more than 0.10 feet above or below the design finished subgrade elevation; any deviation shall not result in changes in drainage areas or ponding. All ground surfaces shall vary uniformly between indicated elevations. Finish drainage ditches shall be graded to allow for proper drainage without ponding and in a manner that will minimize the potential for erosion.
- D. Areas having drainage slopes of one-quarter inch per foot or more shall have grade stakes, set with an instrument, at grid intervals of 50-ft.
- E. Areas having drainage slopes of one-quarter inch per foot or less shall have grade stakes, set with an instrument, at grid intervals of 25-ft.
- F. Correct all settlement and eroded areas for one year after date of project completion at no additional expense to Owner. Bring paved and landscaped areas to proper elevation. Replant or replace any grass, shrubs, bushes, or other vegetation disturbed by construction using corrective measures.

### 3.20 MAINTENANCE AND PROTECTION

- A. Protect newly graded areas from traffic, freezing, and erosion. Keep free of trash and debris.
- B. Protect subgrade from excessive construction traffic and wheel loading including concrete and dump trucks.

- C. Repair and re-establish grades to specified tolerances where completed or partially completed surfaces become eroded, rutted, settled, or lose compaction due to subsequent construction operations or weather conditions. Scarify or remove and replace material to depth directed by the Engineer; reshape and recompact at optimum moisture content to the required density.
- D. Where settling occurs during the project correction period, remove finished surfacing, backfill with additional approved material, compact, and reconstruct surfacing. Restore appearance, quality, and condition of finished surfacing to match adjacent work, and eliminate evidence of restoration. The subgrade material is extremely moisture sensitive so appropriate surface drainage and protection methods such as trenching, sloping, and pumping should be implemented to maintain the subgrade in a dry and workable condition.

## SECTION 312100 - AGGREGATE MATERIALS

### PART 1 GENERAL

#### 1.01 SECTION INCLUDES

- A. Aggregate materials for use as specified in other Sections.

#### 1.02 RELATED SECTIONS

- A. Section 312100 - Earthwork
- B. Section 312200 - Erosion Control and Sedimentation
- C. Geotechnical report (under separate cover)
- D. Construction Drawings

#### 1.03 REFERENCE STANDARDS

- A. American Society for Testing and Materials (ASTM) latest edition
  - 1. C136 Method for Sieve Analysis of Fine and Coarse Aggregates
  - 2. D 698 Laboratory Compaction Characteristics of Soil Using Standard Effort (12,400 ft-lbf/ft<sup>3</sup> (600 kN.m/m<sup>3</sup>))
  - 3. D 1557 Laboratory Compaction Characteristics of Soil Using Modified Effort (56,000 ft-lbf/ft<sup>3</sup> (2,700 Kn.m/m<sup>3</sup>))
  - 4. D 2216 Laboratory Determination of Water (Moisture) Content of Soil, Rock, and Soil-Aggregate Mixtures
  - 5. D 2487 Classification of Soils for Engineering Purposes
  - 6. D 2922 Density of Soil and Soil-Aggregate In Place by Nuclear Methods (Shallow Depth)
  - 7. D 3017 Water Content of Soil and Rock in Place by Nuclear Methods (Shallow Depth)
  - 8. D 4318 Liquid Limit, Plastic Limit, and Plasticity Index of Soils
- B. American Association of State Highway and Transportation Officials (AASHTO) latest edition T 88 Particle Size Analysis of Soils.

#### 1.04 QUALITY ASSURANCE

- A. Tests and analysis of aggregate materials will be performed in accordance with ASTM and AASHTO procedures specified herein.

**1.05 SUBMITTALS**

- A. Submit 30-pound sample of each aggregate or mixture that is to be incorporated into project in air-tight containers to the independent testing laboratory or submit gradation and certification of aggregate material that is to be incorporated into project to the independent testing laboratory for review.
- B. Submit name of each material supplier and specific type and source of each material. Any change in source requires approval of Owner.

**PART 2 PRODUCTS**

**2.01 MATERIALS**

- A. Construction and materials shall meet or exceed the most stringent requirements of this Section and/or the requirements of the Geotechnical report prepared by others, and applicable state highway department specifications section(s) referred to or noted on the Construction Drawings which pertain to paving base course design, materials, preparation, and execution. Materials shall be as indicated in the Construction Documents and shall comply with state highway department specifications regarding source, quality, gradation, soundness, absorption, liquid limit, plasticity index, and mix proportioning.
- B. Soil Materials
  - 1. Class II: Coarse-Grained Soils; conforming to ASTM D2487 Group Symbol, GW, GP, SW and SP.
  - 2. Class III: Coarse-Grained Soils with Fines; conforming to ASTM D2487 Symbol GM, GC, SM and SC.
  - 3. Class IV-A: Fine-Grained Soils (inorganic); conforming to ASTM D2487 Group Symbol ML and CL.
  - 4. Class IV-B: Fine Grained Soils (inorganic); conforming to ASTM D2487 Group Symbol MH and CH.
  - 5. Class V: Organic Soils; conforming to ASTM D2487 Group Symbol OL, OH, and PT.
- C. Aggregate Material
  - 1. Coarse Aggregate Type A1: Material shall be sound crushed limestone, crushed slag, granulated slag, crushed gravel, or other types of suitable material meeting the requirements of this section. Crushed limestone, crushed slag and crushed gravel shall meet the following grading requirements:

Sieve Size	Percent Passing
1 1/2 inches	100
1 inch	75-100
3/4 inch	60-100
3/8 inch	35-75
No. 4	30-60
No. 30	7-30
No. 200	0-5

2. Coarse Aggregate Type A2: Material shall be crushed carbonate, crushed gravel, crushed air-cooled slag, granulated slag, a mixture of crushed and granulated slag, or other types of suitable material meeting the requirements of this item. Crushed carbonate stone or mixtures of crushed and granulated slags shall meet the following gradation requirements:

Sieve Size	Percent Passing
2 inches	100
1 inch	70-100
3/4 inch	50-90
No. 4	30-60
No. 30	7-30
No. 200	0-5

3. Aggregate Type A3: Pea Gravel – Natural stone; washed, free of clay, shale, organic matter; graded in accordance with ASTM C136 and D2487; to the following limits:

- a. Minimum size: 1/4 inch
- b. Maximum Size: 5/8 inch

4. Fine Aggregate Type A4: Sand – Natural river or bank sand; washed; free of silt, clay, loam, friable or soluble materials, and organic matter; graded in accordance with ASTM C136 and D2487; within the following limits:

Sieve Size	Percent Passing
No. 4	90-100
No. 50	7-40
No. 200	0-5

5. Class I-A: Material shall be sound crushed limestone, crushed slag, granulated slag, crushed gravel, or other types of suitable material meeting the requirements of this item. Crushed limestone, crushed slag and crushed gravel shall meet the following grading requirements:

Sieve Size	Percent Passing
1-1/2 inches	100
No. 4	≤ 10
No. 200	< 5

6. Class I-B: Material shall be crushed carbonate, crushed gravel, crushed air-cooled slag, granulated slag, a mixture of crushed and granulated slag, or other types of suitable material meeting the requirements of this item. Crushed carbonate stone or mixtures of crushed and granulated slags shall meet the following gradation requirements:

Sieve Size	Percent Passing
1-1/2 inches	100
No. 4	≤ 50
No. 200	< 5

7. Free draining crushed stone for beneath building floor slab shall be ¾ inch class crushed AASHTO No. 57 stone.
8. Dense graded aggregate shall consist of broken stone conforming to NJDOT Section 901.08 and shall meet the following gradation requirements:

Sieve Size:	Percent
1 ½"	100
¾"	55-90
No. 4	25-60
No. 50	5-25
No. 200	30-12

## 2.02 EQUIPMENT

- A. Transport off-site materials to project using well-maintained and operating vehicles. Once on site, transporting vehicles shall stay on designated limits of disturbance and haul roads and shall at no time endanger any improvements by rutting, overloading, or pumping.

## PART 3 EXECUTION

### 3.01 STOCKPILING

Stockpile on-site at locations indicated by Owner in such manner that there will be no standing water or mixing with other materials.

### 3.02 BORROW AND SPOIL SITES

Upon completion of borrow and/or spoil operations, clean up borrow and/or spoil areas as indicated on Construction Drawings in neat and reasonable manner to satisfaction of property owner and Owner.

## END OF SECTION 312100

\\\\languan.com\data\PAR\data2\101053201\Project Data\Specifications\FOR BID\312100 Aggregate Materials.docx

## **SECTION 312200 - SOIL EROSION AND SEDIMENTATION CONTROL**

### **PART 1 - GENERAL**

#### **1.01 SECTION INCLUDES**

- A. Installation of temporary and permanent erosion control systems.
- B. Installation of temporary and permanent slope protection systems.

#### **1.02 RELATED SECTIONS**

- A. Section 312000 – Earthwork
- B. Section 334100 – Storm Drainage
- C. Section 329100 – Planting
- D. Construction Drawings

#### **1.03 QUALITY ASSURANCE**

- A. The Contractor shall implement soil erosion controls in a timely manner.
- B. The Contractor shall carefully adhere to the construction sequence that is shown on the construction drawings.
- C. The Contractor shall follow Soil Erosion and Sediment Control Notes that are shown on the construction drawings and local regulations.
- D. The Contractor shall make frequent inspection of temporary soil erosion controls and maintain them in working order until permanent soil erosion controls are established.

#### **1.04 ENVIRONMENTAL REQUIREMENTS**

- A. The contractor shall protect adjacent properties and water resources from soil erosion and sediment damage throughout construction.
- B. Discharge from dewatering operations shall not be directed to surface waters.

## **PART 2 - PRODUCTS**

### **2.01 MATERIALS**

- A. Quick growing grasses such as wheat, rye, or oats in accordance with Section 329100.
- B. Hay or straw bales as specified on Construction Drawings.
- C. Fencing for siltation control as specified on Construction Drawings.
- D. Curlex blankets by American Excelsior Company or approved equal.
- E. TMAX by North American Green or approved equal.
- F. Bale stakes for each bale shall be minimum of 4-feet in length and shall be either two #2 rebars, two steel pickets, or two 2-inch x 2-inch hardwood stakes driven 1'-6" into ground.
- G. Temporary mulches such as loose hay, straw, netting, wood cellulose, or agricultural silage.
- H. Fence stakes shall be minimum of 5-ft in length and be either metal stakes or 2-inch x 2-inch hardwood stakes driven 1'-6" into ground.
- I. Temporary and Permanent Outfall Structures as specified on Construction Drawings.

## **PART 3 - EXECUTION**

### **3.01 PREPARATION**

- A. Review Construction Drawings.
- B. Conduct pre-construction meeting with Site Contractor.

### **3.02 EROSION CONTROL AND SLOPE PROTECTION IMPLEMENTATION**

- A. Place erosion control systems in accordance with Construction Drawings or as may be dictated by site conditions in order to maintain the intent of the specifications and permits at no additional cost to Owner.
- B. Deficiencies or changes on Construction Drawings shall be implemented as site conditions change.
- C. Owner has authority to limit surface area of erodible earth material exposed by clearing and grubbing, excavation, borrow and embankment operations and to direct Contractor to provide immediate permanent or temporary pollution control measures.

- D. Maintain temporary erosion control systems as directed by Owner or governing authorities to control siltation during life of contract. Contractor shall respond to maintenance or additional work ordered by Owner or governing authorities within 48 hours or sooner if required at no additional cost to the Owner.
- E. Contractor will be required to incorporate permanent erosion control features into project at earliest practical time to minimize need for temporary controls.
- F. Permanently seed and mulch cut slopes as excavation proceeds to extent considered desirable and practical.
- G. Slopes that erode easily or that will not be graded for a period of 14 days or more shall be temporarily seeded as work progresses with wheat, rye, or oats application in accordance with Section 329100 unless otherwise specified on the Construction Drawings.

**END OF SECTION 312200**

\\langan.com\data\PAR\data2\101053201\Project Data\Specifications\FOR BID\312200 Soil Erosion and Sedimentation Control.docx

## **SECTION 312333 – EXCAVATION, BACKFILL AND COMPACTION FOR UTILITIES**

### **PART 1- GENERAL**

#### **1.01 SUMMARY**

- A. Excavation of trenches for installation of utilities.
- B. Backfilling trenches with bedding material as specified and filling trenches with suitable material to proposed subgrade.
- C. Compacting backfill materials in acceptable manner.

#### **1.02 RELATED SECTIONS**

- A. Section 024113 – Site Demolition
- B. Section 312200 – Earthwork
- C. Section 331100 - Water Distribution Systems
- D. Section 334900 - Storm Drainage
- E. Section 321123 - Aggregate Materials
- F. Construction Drawings

#### **1.03 REFERENCE STANDARDS**

See Related Sections.

#### **1.04 QUALITY ASSURANCE**

- A. An independent testing laboratory will perform testing at intervals not exceeding 200-feet of trench for first and every other 8-inch lift of compacted trench backfill and furnish copies of results as specified herein.
- B. Testing shall be in accordance with Part 3, Section 3.06, “Field Quality Control”.

#### **1.05 SUBMITTALS**

- A. Shop drawings or details pertaining to site utilities are not required unless required by regulatory authorities or unless uses of materials, methods, equipment, or procedures that are contrary to Construction Drawings or Specifications are proposed. Do not perform work until Owner has accepted required shop drawings.
- B. Submit 30-pound sample of each type of off-site fill material that is to be used in backfilling in air-tight container(s) to the independent testing laboratory or submit gradation and certification of aggregate material that is to be used at the site to the independent testing laboratory for review.

1.06 PROJECT RECORD DOCUMENTS

- A. Accurately record actual locations of subsurface utilities, structures, and obstructions installed or encountered.

PART 2 - PRODUCTS

2.01 MATERIALS

- A. Bedding Material: Aggregate Type as indicated on the plans and as specified in Section 321123.
- B. Haunching Material: As specified in Section 321123. Aggregate Type as indicated on the plans and as specified in Section 321123.
- C. Backfill material from off-site as specified in Section 312200 and approved by Owner.
- D. Backfill material shall not contain rock or stone with a maximum size greater than 2 inches.

2.02 LOCATOR TAPE

- A. Locator tape shall be heavy duty 6" wide underground warning tape. Tape shall be made from polyethylene material, 3.5 mils thick, with a minimum tensile strength of 1,750 psi. Place the tape at one-half the minimum depth of cover for the utility line or a maximum of 3', which ever is the lesser, but never above the top of subgrade. Color of tape shall be determined by APWA Color Standards: Electric - Red, Telephone - Orange.

2.03 EQUIPMENT

- A. Transport off-site materials to project using well-maintained and operating vehicles. Once on site, transporting vehicles shall stay on designated haul roads and shall at no time endanger improvements by rutting, overloading, or pumping.

PART 3 - EXECUTION

3.01 PREPARATION

- A. Set lines, elevations, and grades for proposed systems.
- B. Protect benchmarks, property corners, and other survey monuments from damage or displacement. If marker needs to be removed it shall be referenced by licensed land surveyor and replaced, as necessary, by same.
- C. Maintain in operating condition existing utilities, previously installed utilities, and drainage systems encountered in utility installation. Repair surface or subsurface improvements shown on Construction Drawings.

- D. Verify location, size, elevation, and other pertinent data required making connections to existing utilities and drainage systems as indicated on Construction Drawings.
- E. Over excavate and properly prepare areas of subgrade that are not capable of supporting proposed systems. Stabilize these areas by using acceptable geotextile.
- F. Provide dewatering systems as required for utility excavations. Dewatering systems shall comply with requirements of Section 312200.

### 3.02 EXCAVATION

- A. Contract local utility companies before excavation begins. Dig trench at proper width and depth for laying pipe, conduit, or cable. Cut trench banks vertical, if possible, and remove stones from bottom of trench as necessary to avoid point-bearing. Over excavate wet or unstable soil, if encountered, from trench bottom as necessary to provide suitable base for continuous and uniform bedding.
- B. Trench excavation sidewalls shall be sloped, shored, sheeted, braced, or otherwise supported by means of sufficient strength to protect workmen in accordance with applicable rules and regulations established for construction by the Department of Labor, Occupational Safety and Health Administration (OSHA), and by local ordinances. Lateral travel distance to exit ladder or steps shall not be greater than 25-feet in trenches 4-feet or deeper.
- C. Perform excavation as indicated on Construction Drawings for specified depths. During excavation, stockpile materials suitable for backfilling in orderly manner far enough from bank of trench to avoid overloading, slides, or cave-ins.
- D. Remove excavated materials not required or not suitable for backfill or embankments and waste off-site or at on-site locations approved by the Owner and in accordance with governing regulations. Dispose of structures discovered during excavation as specified in Section 024113.
- E. Prevent surface water from flowing into trenches or other excavations by temporary grading or other methods, as required. Remove accumulated water in trenches and other excavations as specified in Section 312200.
- F. Open cut excavation with trenching machine or backhoe. Where machines other than ladder or wheel-type trenching machines are used, do not use clods for backfill. Dispose of unsuitable material and provide other suitable material at no additional cost to Owner.
- G. Accurately grade trench bottom to provide uniform bearing and support for each section of pipe on bedding material at every point along entire length, except where necessary to excavate for bell holes, proper sealing of pipe joints, or other required connections. Dig bell holes and depressions for joints after trench bottom has been graded. Dig no deeper, longer, or wider than needed to make joint connection properly.
- H. Trench width below top of pipe shall not be less than 12-inches or more than 18-inches wider than outside surface of pipe or conduit that is to be installed to designated elevations and grades. Other trench width for pipe, conduit, or cable shall be least practical width that will allow for proper compaction of trench backfill.

- I. Trench depth requirements measured from finished grade or paved surface shall meet the following requirements or applicable codes and ordinances, whichever is more stringent:
  - 1. Water Mains: 30-inches to top of pipe barrel or 6-inches below frost line, established by local building official, whichever is deeper.
  - 2. Storm Sewer: Elevations and grades as indicated on Construction Drawings.
  - 3. Electrical Conduits: 24-inches minimum to top of conduit or as required by NEC 300-5, NEC 710-36 codes, or local utility company requirements, whichever is deeper.
  - 4. Telephone Conduits: 18-inches minimum to top of conduit, or as required by local utility company, whichever is deeper.

### **3.03 PIPE BEDDING**

- A. Accurately cut trenches for pipe or conduit that is to be installed to designated elevations, 4-inches below bottom of pipe and to the width as specified herein. Place 4-inches of bedding material, compact in bottom of trench, and accurately shape to conform to lower portion of pipe barrel.

### **3.04 BACKFILLING**

- A. Criteria: Do not backfill trenches until required tests are performed and utility systems comply with and are accepted by applicable governing authorities. Backfill trenches as specified in Sections 312200 and one or more of the following sections, as applicable: or 332334 for trenches below pavements. If improperly backfilled, reopen to depth required to obtain proper compaction. Backfill and compact, as specified herein, to properly correct the condition in an acceptable manner.
- B. Backfilling: After pipe or conduit has been installed, bedded, and tested as required, backfill trench or structure excavation with specified material placed as given in the Construction Documents.
- C. Backfill trenches to contours and elevations shown on Construction Drawings with unfrozen materials.
- D. Systematically backfill to allow maximum time for natural settlement. Do not backfill over porous, wet, frozen, or spongy subgrade surfaces.

### **3.05 COMPACTION**

- A. Exercise proper caution when compacting immediately over top of pipes or conduits. Water jetting or flooding is not permitted as method of compaction.
- B. Maintain optimum moisture content of fill materials as specified in Section 312200 to attain required compaction density.
- C. Materials used for backfill shall comply with requirements of Section 321123 and as specified herein.

### **3.06 FIELD QUALITY CONTROL**

**PART 4 - MEASUREMENT AND PAYMENT**

**4.01 MEASUREMENT AND PAYMENT**

The price bid for all excavation, backfill, compaction and testing as described in Section 312333 Excavation, Backfill, and Compaction for Utilities shall be included in the respective Items that include excavation, backfill and compaction for utilities in order to properly complete Contract work.

**END OF SECTION**

## SECTION 313200 – SOIL STABILIZATION

### PART 1 - GENERAL

#### 1.01 SUMMARY

- A. Excavation, treatment, and backfilling of subgrade for lime stabilization.
- B. Excavation, treatment, and backfilling of subgrade for cement stabilization.
- C. Excavation, treatment, and backfilling of subgrade for fly ash stabilization.
- D. Excavation, treatment, and backfilling of subgrade for bridge lift stabilization.
- E. Installation of Geotextile Fabric for stabilization of subgrade.

#### 1.02 RELATED SECTIONS

- A. Section 312200 - Earthwork
- B. Section 312333 - Excavation, Backfill, and Compaction for Utilities
- C. Section 332334 - Excavation, Backfill, and Compaction for Pavement
- D. Section 321123 - Aggregate Materials
- E. Construction Drawings

#### 1.03 REFERENCE STANDARDS

- A. American Society for Testing Materials (ASTM) latest edition
  - 1. C 150 Portland Cement
  - 2. C 618 Fly Ash and Raw or Calcined Natural Pozzolan for use as a Mineral Admixture in Portland Cement Concrete
  - 3. C 977 Quicklime and Hydrated Lime for Soil Stabilization
  - 4. D 1633 Compressive Strength of Molded Soil-Cement Cylinders
- B. American Association of State Highway and Transportation Officials (AASHTO) latest edition
  - 1. M 216 Lime for Soil Stabilization
- C. National Lime Association (NLA)
  - 1. Bulletin 326 Lime Stabilization Construction Manual

1.04 ENVIRONMENTAL REQUIREMENTS

- A. Do not install mixed materials in wind in excess of 10 mph or when temperature is below 40 degrees Fahrenheit.

1.05 QUALITY ASSURANCE

- A. Perform work in accordance with state and local standards in conjunction with requirements specified herein.

1.06 SUBMITTALS

- A. Submit 30-pound sample of each material to be used at the site in airtight containers to the independent testing laboratory or submit gradation and certification of material that is to be used to the independent testing laboratory for review.
- B. Submit name of each materials supplier and specific type and source of each material. Change in source requires approval of Owner.
- C. Submit mix design and materials mix ratio that will achieve specified requirements of state and local agencies for soil stabilization.

**PART 2 - PRODUCTS**

2.01 MATERIALS

- A. Hydrated Lime
- B. Portland Cement: ASTM C150, Normal Type I
- C. Fly Ash: ASTM C977 or AASHTO M216
- D. Coarse Aggregate: Type A1
- E. Fine Aggregate: Type A4
- F. Subsoil: Existing to be Reused, Type S1
- G. Surge Stone

2.02 ACCESSORIES

- A. Curing Seal: Asphalt Emulsion Primer
- B. Geotextile Fabric for Stabilization
  - 1. Mirafi 500X or 600X
  - 2. Phillips 66 Supac 6WS

3. Dupont Typar 3401 and 3601
4. Trevira S1114 and S1120
5. Tensar SS-1 and SS-2
6. Exxon GTF-200 or 350
7. TerraTex HD and GS
8. Or approved equal

### 2.03 EQUIPMENT

- A. Perform operations using suitable, well maintained equipment capable of excavating subsoil, mixing and placing materials, wetting, consolidating, and compacting of material.

## PART 3 - EXECUTION

### 3.01 PREPARATION

- A. Obtain approval from the independent testing laboratory of mix design before proceeding with placement.
- B. Start stabilization only when weather and soil conditions are favorable for successful application of proposed material.
- C. Proofroll subgrade to identify areas in need of stabilization.

### 3.02 EXCAVATION

- A. Excavate subsoil to depth sufficient to accommodate soil stabilization.
- B. Remove lumped subsoil, boulders, and rock that interfere with achieving uniform subsoil conditions.
- C. Do not excavate within normal 45 degree bearing splay of any foundation.
- D. Notify Construction Manager of unexpected subsurface conditions. Discontinue affected work in area until notified to resume work.
- E. Correct areas over-excavated in accordance with Section 312200.
- F. Remove excess excavated material from site.

### 3.03 GEOTEXTILE FABRIC

- A. Place geotextile fabric over subsoil surface, lap edges and ends in accordance with manufacturer's recommendations in those areas that are shown on Construction Drawings

or in those areas that need additional stabilization prior to placement of base course. Bridge lift sections may require the use of geotextile fabric for stabilization prior to placement of fill.

- B. Place geotextile fabric specified on Construction Drawings and in Specifications in accordance with manufacturer's recommendations.

### 3.04 SOIL TREATMENT AND BACKFILLING

- A. Lime Stabilized Subgrade: Where indicated on Construction Drawings or as required after continual failure, treat prepared subgrade with hydrated lime in accordance with state highway department specifications.
- B. Cement Stabilized Subgrade: Where indicated on Construction Drawings or as required after continual failure, treat prepared subgrade with portland cement in accordance with state highway department specifications.
- C. Fly Ash Stabilized Subgrade: Where indicated on Construction Drawings or as required after continual failure, treat prepared subgrade with fly ash in accordance with state highway department specifications.
- D. Bridge Lifts: Where indicated on Construction Drawings or as required after continual failure, treat prepared subgrade by application of a bridge lift. Bridging over existing soils shall be acceptable only when approved in writing by the Owner. Place geotextile fabric or geogrid over existing soils to be bridged. The geotextile fabric or geogrid selected shall be appropriate for the bridge lift material being placed. Place bridge lift over geotextile fabric or geogrid. Bridge lift material may be surge stone, granular fill, or shot rock fill. Granular material shall be in accordance with Section 321123. Surge stone and shot rock will be approved by the Owner's representative on a submittal basis. The Owner and the Owner's representative shall have sole discretion as to the acceptability of all submittals.
- E. Backfill and compaction of treated subsoil shall be in accordance with Sections 312200, 312333 and 332334.
- F. Maintain optimum moisture of mixed materials to attain required stabilization and compaction.
- G. Finish subgrade surface in accordance with Section 312200.
- H. Remove surplus mix materials from site at no additional cost to the Owner.

### 3.05 CURING

- A. Immediately following compaction of mix, seal top surface with curing seal.
- B. Do not permit traffic for 72 hours after sealing top surface.

### 3.06 FIELD QUALITY CONTROL

- A. Compression test and analysis of hardened fill material will be performed in accordance with Section 312200.
- B. If tests indicate work does not meet specified requirements, remove work, replace and retest.

**END OF SECTION**

\\langan.com\data\PAR\data2\101053201\Project Data\Specifications\FOR BID\313200 Soil Stabilization.doc

## **SECTION 315000 - TEMPORARY EXCAVATION SUPPORT AND PROTECTION**

### **PART 1 - GENERAL**

#### **1.1 SCOPE OF WORK**

- A. Provision of all temporary excavation support necessary to facilitate proposed construction at the Site required by the Construction Drawings and Technical Specifications. Contractor shall supply all materials, equipment and labor required to furnish, install, maintain, and remove an excavation support and protection system capable of supporting excavation sidewalls, and of resisting soil and hydrostatic pressure.
- B. Protection of adjacent structures, utilities, parking lot areas, and roadways which are to remain. Contractor shall install, maintain, and (where required) remove its temporary excavation support and protection system so as not to damage any existing utilities that are to remain.

#### **1.2 RELATED SECTIONS AND DOCUMENTS**

- A. Section 011100 – General Requirements
- B. Section 311000 – Site Preparation
- C. Section 312000 – Earthwork
- D. Federal Occupational Safety and Health Administration (OSHA), U.S. Department of Labor general industry (29 CFR 1910) and construction (29 CFR 1926) standards, latest adopted version.

#### **1.3 QUALITY ASSURANCE**

- A. Contractor shall provide at least one supervisory person who shall be present at all times during execution of the Work and who is thoroughly familiar with the type of Work being performed and its best methods for completion. This person shall have the authority to act on behalf of Contractor.
- B. Contractor shall comply with any provisions of all applicable Federal, State, and Local requirements, codes, regulations and standards.
- C. Contractor shall be solely responsible for the method and adequacy of his temporary excavation support system.
- D. Contractor shall have the sole responsibility for coordinating his Work with Geotechnical Engineer to assure that all tests and procedures required by the Construction Documents are properly provided. Contractor shall cooperate fully with Geotechnical Engineer and Owner's Engineer in the performance of its Work.

#### **1.4 SUBMITTALS**

- A. Unless otherwise indicated, transmit all submittals to Owner and Geotechnical Engineer. Contractor will receive acknowledgement for concepts and details shown. Such acknowledgement shall be of the concept only and shall not in any way diminish or relieve Contractor of sole responsibility for the adequacy of his procedures and the satisfactory performance of his excavation support and protection system.
- B. Contractor shall submit satisfactory proof of qualifications for performing the Work specified herein, at least two weeks prior to the delivery of any equipment or materials to the Site.
- C. Contractor shall submit his excavation support and protection plan and methods a minimum of two weeks prior to the start of Work and shall include the following:
  - 1. Details, arrangement, and method of assembly of proposed system components.
  - 2. Location of the excavation support system installation.
  - 3. Typical cross-section, including:
    - ☐ Full excavation depth.
    - ☐ Elevation for the bottom of the excavation.
    - ☐ Elevation for the top and toe of the support system.
    - ☐ Minimum embedment below the bottom of the excavation.
    - ☐ Location of any necessary bracing.
  - 4. Any required calculations, signed and sealed, as prepared by a New Jersey licensed Professional Engineer. The component members of the system shall be designed for earth pressures, unrelieved hydrostatic pressures, and any construction or vehicle surcharges.
  - 5. The materials and procedures Contractor intends to use for installing and, where necessary, removing the temporary excavation support.
- D. Review of Contractor's plans and methods of construction does not relieve Contractor of the responsibility for the adequacy and performance of his temporary excavation support system.

## **PART 2 - PRODUCTS**

### **2.1 EXCAVATION SUPPORT SYSTEM**

- A. Materials comprising or used to fabricate the excavation support system shall be determined by Contractor.

## **PART 3 - EXECUTION**

### **3.1 GENERAL**

- A. Contractor shall install and maintain an excavation support and protection system capable of supporting excavation sidewalls and of resisting soil and superimposed and construction loads.
- B. Contractor shall proceed with caution in the vicinity of existing utilities. Contractor shall expose them by hand excavation or other methods necessary so as to prevent damage to subject utilities. If existing utilities interfere with proposed method of support, the Contractor shall notify Owner and Geotechnical Engineer.
- C. The Contractor shall coordinate Work of this Section with any dewatering requirements.

**3.2 EXCAVATION SUPPORT SYSTEM**

- A. Contractor shall furnish and construct a temporary excavation support system in accordance with its submitted and reviewed plans.
- B. Contractor shall maintain the temporary excavation support system as necessary to facilitate Contract Work.
- C. The excavation support system shall be removed in a manner which permits compaction of the backfill as specified in Section 312000 – Earthwork and results in filling of voids (if any).
- D. The temporary excavation support system shall be left in place only with prior written permission of Owner.

**END OF SECTION 315000**

\\langan.com\data\PAR\data2\101053201\Project Data\Specifications\FOR BID\315000 Temporary Excavation Support and Protection.docx

## SECTION 321216 - ASPHALTIC CONCRETE PAVING

### PART 1 GENERAL

#### 1.01 SECTION INCLUDES

- A. Preparation and placement of asphaltic concrete binder course.
- B. Preparation and placement of asphaltic concrete surface course.
- C. Preparation and placement of asphaltic concrete overlay
- D. Preparation and placement of bituminous seal coat

#### 1.02 RELATED SECTIONS

- A. Section 312000 - Earthwork
- B. Section 321218 - Base Course
- C. Section 321315 - Curbs and Sidewalks
- D. Construction Drawings

#### 1.03 REFERENCE STANDARDS

- A. The Asphalt Institute (AI) latest edition
  - 1. MS 2 Mix Design Methods for Asphaltic Concrete and Other Hot Mix Types
  - 2. MS 3 Asphalt Plant Manual

#### 1.04 QUALITY ASSURANCE

- A. An independent testing laboratory, selected and paid by Contractor, will be retained to perform construction testing of in-place asphaltic concrete courses for compliance with requirements for thickness, compaction, and surface smoothness.
- B. All failed test results to be faxed to the Construction Manager.
- C. In-place compacted thickness shall not be less than thickness specified on Construction Drawings. Areas of deficient paving thickness shall receive tack coat and minimum 1-in. overlay; or shall be removed and replaced to proper thickness, at discretion of Owner; until specified thickness of course is met or exceeded at no additional expense to Owner.
- D. Check surface areas at intervals necessary to eliminate ponding areas. Remove and replace unacceptable paving as directed by Owner.

#### 1.05 SUBMITTALS

- A. Before asphaltic concrete paving is constructed, submit actual design mix to Civil Engineering Consultant of Record and independent testing laboratory for review and approval. Design mix submittal shall follow a format as indicated in Asphalt Institute Manual MS-2, Marshall Stability Method; and shall include type/name of mix, gradation analysis, grade of asphalt cement used, Marshall Stability in pounds (lb.) flow, effective asphalt content in percent (%), and direct references to state highway department specifications sections for each material. Design shall be for mixture listed in current edition of state highway department specifications. Mix designs over 3 years old will not be accepted by Owner.
- B. Submit materials certificate to the independent testing laboratory that is signed by materials producer and Contractor, certifying that materials comply with, or exceed, requirements specified herein.
- C. The Contractor may submit an option for an equivalent Superpave mix, which if accepted, will be provided at no additional expense to the Owner.

#### 1.06 PROJECT CONDITIONS

- A. Weather Limitations:
  - 1. Apply prime and tack coats when ambient or base surface temperature is above 40 degrees Fahrenheit, and when temperature has been above 35 degrees Fahrenheit for 12 hours immediately prior to application. Do not apply when base is wet, contains excess moisture, during rain, or frozen.
  - 2. Construct asphaltic concrete paving when atmospheric temperature is above 40 degrees Fahrenheit.

- B. Maintain access for vehicular and pedestrian traffic as required for other construction activities. Utilize temporary striping, flagmen, barricades, warning signs, and warning lights as required.

## PART 2 PRODUCTS

### 2.01 MATERIALS

- A. Provide asphalt-aggregate mixture in accordance with this Section. If specified aggregate is scarce, use locally available materials and gradations that meet state highway department specifications and exhibit satisfactory records of previous installations.
- B. Asphalt Cement: Comply with AASHTO M 226; Table 2 AC-10, AC-20, or AC-40, viscosity grade, depending on local mean annual air temperature. See chart below:

<u>Temperature Condition</u>	<u>Asphalt Grades</u>
Cold, mean annual air temperature At 45 degrees Fahrenheit or lower	AC-10 85/100 pen.
Warm, mean annual air temperature Between 45 degrees Fahrenheit and 75 degrees Fahrenheit	AC-20 60/70 pen.
Hot, mean annual air temperature At 75 degrees Fahrenheit or higher	AC-40

- C. Prime Coat: Medium curing cut-back asphalt or asphalt penetrating prime coat consisting of either MC-30 or SS-1h.
- D. Tack Coat: Emulsified asphalt; AASHTO M 140 or AASHTO M 208, SS-1h, CSS-1, or CSS-1h, diluted with 1 part water to 1 part emulsified asphalt.
- E. Mineral Filler: Rock or slag dust, hydraulic cement, or other inert material complying with AASHTO M 117, if recommended by state highway department specifications.
- E. Asphalt-Aggregate Mixture: Unless otherwise noted on Construction Drawings, Design Mix shall have minimum stability based on 75-blow Marshall complying with ASTM D 1559 of 1000 pounds with flow between 0.08 and 0.16 inches. The Design Mix shall be within sieve analysis and bitumen ranges specified below unless approved otherwise by Owner prior to placement.

#### SIEVE ANALYSIS OF MIX

Sieve No.	Total Percent Passing	Percent Tolerance
3/4"	100	7
1/2"	90-100	5
4	44-74	4
8	28-58	4
50	5-21	2
200	2-10	0

Percent bitumen by weight of total mix: 5.0 - 8.5 percent

Air voids: 3 - 6 percent

Aggregate voids filled with asphalt cement: 70 - 82 percent

Allowable variance of bitumen by weight of total mix = 0.4 percent

- F. Asphalt Base Course: Base Course Design Mix shall conform to NJDOT TYPE I-2.
- G. Asphalt Wearing Course: Wearing Course Design Mix shall conform to NJDOT TYPE I-5.

## **2.02 EQUIPMENT**

- A. All equipment necessary for the paving of asphaltic concrete shall be on the project prior to beginning paving operations.
- B. Maintain equipment in satisfactory operating condition and correct breakdowns in manner that will not delay or be detrimental to the schedule of paving operations.

## **PART 3 EXECUTION**

### **3.01 PREPARATION**

- A. Proofroll prepared base material surface to check for unstable areas. Paving work shall begin only after unsuitable areas have been corrected and are ready to receive paving.
- B. Remove loose material from compacted base material surface immediately before applying prime coat.
- C. Establish and maintain required lines and elevations.
- D. Cover the surfaces of curbs, gutters, manholes and other structures the asphaltic concrete mixture will be placed against with a thin, uniform coat of liquid asphalt. Where the asphaltic concrete mixture will be placed against the vertical face of an existing pavement, clean the vertical face to remove foreign substances and apply a coating of liquid asphalt at a rate of approximately 0.25 gallons per square yard.
- E. Asphalt overlay work shall include installing a new bituminous pavement wearing course over a properly prepared existing bituminous pavement. Longitudinal joints should not be placed over existing longitudinal joints. If possible, paving should be placed in the opposite direction to the original and at a minimum; the longitudinal joints should be placed at the center of the existing paving strips. Paved transition areas will be installed to allow smooth egress from the new bituminous pavement overlay to the existing pavement.
- F. The Contractor is required to correct the weaker areas of the existing pavement in order to provide a uniform foundation for the overlay. The Contractor will utilize a heavily loaded tandem to traverse the existing pavement that will receive the new overlay. Under the supervision of the Owners geotechnical field engineer, areas showing deflections in

excess of 1" should be improved in accordance with the procedures for repair of alligator-type distress cracks and potholes. Any large distortions of the grade shall be corrected by construction of leveling courses and/or leveling wedges so as to restore the proper line and cross section prior to the installation of the new overlay. Repair cracks of less than one inch in width by thoroughly cleaning the cracks with compressed air and filling the cracks with the appropriate sealant. Large cracks in excess of one inch are to be filled with bituminous pavement material after cleaning, but prior to applying the sealant. When performing the above crack repairs, a hand torch or weed killer is to be used to destroy all existing vegetation. Any areas in the opinion of the Owner's geotechnical field engineer that after crack and pothole repair pose the danger of reflective cracking through the new overlay are to be reinforced with a pavement reinforcement Geogrid equal to HATELIT 2015 Geogrid manufactured by Huesker Inc., Charlotte, NC (800-942.9418). The Contractor will be required to make any adjustments to manholes, valve boxes and other pavement fixtures in order to bring them up to the new proposed finished grade.

- G. Before placement of the new overlay, the Contractor will thoroughly clean and sweep the existing pavement in order to remove all loose materials and contaminants. After cleaning, a tack coat of SS-1, SS-1h CSS-1 or CSS-1h in emulsified asphalt, diluted with equal parts of potable water will be applied at a rate of 0.05 to 0.15 gals/sy in a manner that will provide thorough coverage of the entire surface. Any pools of tack coat material shall be swept to higher areas to dry. Extreme care should be taken during tack coat application to thoroughly protect all buildings, walls, curbs or other improvements from the emulsion spray.
- H. Localized areas of alligator-type distress cracks, potholes or other severely distressed areas are to be sawcut in a neat manner using a pavement saw forming a square or rectangular shape to a distance of at least one foot beyond the limits of the affected area. Remove the bituminous pavement and expose the existing sub-base materials so that the sub-base materials can be proof-rolled in order to visually assess the stability of the sub-base materials. Materials that are observed to be unstable are to be removed to expose suitable materials or to a depth of two feet beneath the ground surface, whichever is less. The resulting excavation shall be backfilled to the design pavement subgrade level with material meeting the requirements for Dense Graded Aggregate and compacted to 95 percent of maximum dry density as determined by the ASTM-D 1557 test procedure. Four inches of bituminous stabilized base material is to be placed on top of the new OGA material to an elevation equal to the existing surrounding grade after applying a tack coat to the surface of the existing pavement to insure a good bond between the new stabilized base material and existing asphalt.
- I. Where the new bituminous overlay abuts concrete curbing that is not required to be replaced, a minimum 4" reveal must be maintained. The Contractor will be required to remove enough existing pavement in order to maintain the overlay thickness within three feet of the curb.
- J. The Contractor shall construct transition pavement at a minimum width of four feet in order to taper from the new overlay thickness to the existing pavement elevation. The four foot transition area is to be milled and the transition pavement is to be anchored to the existing pavement by neatly cutting and removing a 12' wide section of the existing pavement and installing the end of the transition pavement in the 12' *wide* section. The edges of the transition pavement shall be sealed.

- K. Pavement areas determined by the Owner's geotechnical engineer to be in good condition and identified on the plans to receive seal coats and generally exhibiting random cracking of up to 1" inch in width and some raveling of the fine aggregate shall be covered with two (2) seal coats of coal emulsion blend with 3 to 5 # of sand per gallon with appropriate latex additives. The emulsion should be diluted and sprayed at a rate of 0.1 to 0.15 gal/syd, depending on the texture and absorption rate of the existing asphalt. Random cracks should be filled with hot pour rubberized liquid asphalt crack filler (oil jacketed or direct fire). The cracks should be prepared for filling by removing vegetation, cleaning with a broom or a stream of compressed air, and the application of a soil sterilant if weed growth is anticipated. Larger cracks should be filled with a fine sand-asphalt hot mix.

### 3.02 APPLICATIONS

- A. Prime Coat:
1. Apply bituminous prime coat to base material surfaces at least 24 hours in advance, where asphaltic concrete paving will be constructed.
  2. Apply bituminous prime coat in accordance with state highway department specifications.
  3. Apply at minimum rate of 0.25 gal per sq. yd over compacted base material. Apply to penetrate and seal, but not flood surface.
  4. Take necessary precautions to protect adjacent areas from over spray.
  5. Cure and dry as long as necessary to attain penetration of compacted base and evaporation of volatile substances.
- B. Tack Coat:
1. Apply to contact surfaces of previously constructed asphaltic concrete base courses or portland cement concrete and surfaces abutting or projecting into asphaltic concrete or into asphaltic concrete pavement.
  2. Apply tack coat to asphaltic concrete base course or sand asphalt base course. Apply emulsified asphalt tack coat between each lift or layer of full depth asphaltic concrete and sand asphalt bases and on surface of bases where asphaltic concrete paving will be constructed.
  3. Apply emulsified asphalt tack coat in accordance with state highway department specifications.
  4. Apply at minimum rate of 0.05 gal per sq. yd of surface.
  5. Allow drying until at proper condition to receive paving.

### 3.03 ASPHALTIC CONCRETE PLACEMENT

- A. Place asphaltic concrete mixture on completed compacted subgrade surface, spread, and strike off. Spread mixture at following minimum temperatures:
1. Ambient temperature between 40 degrees Fahrenheit and 50 degrees Fahrenheit, mixture temp. = 285 degrees Fahrenheit
  2. Ambient temperature between 50 degrees Fahrenheit and 60 degrees Fahrenheit, mixture temp. = 280 degrees Fahrenheit
  3. Ambient temperature higher than 60 degrees Fahrenheit, mixture temp. = 275 degrees Fahrenheit
- B. Whenever possible, spread pavement by finishing machine; however, inaccessible or irregular areas may be placed by hand methods. Spread hot mixture uniformly to

required depth with hot shovels and rakes. After spreading, carefully smooth hot mixture to remove segregated course aggregate and rake marks. Rakes and lutes used for hand spreading shall be type designed for use on asphalt mixtures. Do not dump loads faster that they can be properly spread. Workers shall not stand on loose mixture while spreading.

- C. Paving Machine Placement: Apply successive lifts of asphaltic concrete in transverse directions with surface course placed parallel to flow of traffic. Place asphaltic paving in typical strips not less than 10'-0" wide. Where thickness of finished paving will be greater than 3 inches, spread in equal lifts of 3 inch maximum and 1 inch minimum. Where the thickness of finished paving will be 3 inches or less, spread in one layer.
- D. Joints: Make joints between old and new pavements, or between successive days and work in manner that will provide continuous bond between adjoining work. Construction joints shall have same texture, density, and smoothness as other sections of asphaltic concrete course. Clean contact surfaces of joints and apply tack coat.

### 3.04 ROLLING AND COMPACTION

- A. Mixture, after being spread, shall be thoroughly compacted by rolling as soon as it will bear the weight of rollers without undue displacement. Number, weight, types of rollers, and sequences of rolling operations shall be such that the required density and surface are consistently attained while the mixture is in workable condition.
- B. Compact mixture with hot hand tampers or vibrating plate compactors in areas inaccessible to rollers.
- C. Breakdown Rolling: Accomplish breakdown or initial rolling immediately following rolling of joints and outside edge. Check surface after breakdown rolling and repair displaced areas by loosening and filling with hot material.
- D. Second Rolling: Follow breakdown rolling as soon as possible, while mixture is hot. Continue second rolling until mixture has been thoroughly compacted.
- E. Finish Rolling: Perform finish rolling while mixture is still warm enough for removal of roller marks. Continue rolling until roller marks are eliminated and course has attained maximum density.
- F. Patching: Remove and replace paving areas mixed with foreign materials and defective areas. Cut out such areas and fill with fresh, hot asphaltic concrete. Compact by rolling to maximum surface density and smoothness.
- G. Protection: After final rolling, do not permit vehicular traffic on pavement until it has cooled and hardened. Erect barricades to protect paving from traffic until mixture has cooled enough not to become marked. Any masked or marred finish surfaces shall be repaired or smoothed.

### 3.05 JOINTS

- A. General

1. Place each asphaltic paving layer as continuous as possible to keep the number of joints to a minimum. Create joints between old and new pavement, between successive days' work, and where the mixture has become cold (less than 140 degrees F). Make these joints in such a manner as to create a continuous bond between the old and new pavement construction courses.
  2. When the pavement construction involves 2 or more courses, offset successive courses by at least 6 inches.
- B. Transverse Joints: If placing of material is discontinued or if material in place becomes cold, make a joint running perpendicular to the direction traveled by the paver. Before placement continues, trim the edge of the previously placed pavement to a straight line perpendicular to the paver and cut back to expose an even vertical surface for the full thickness of the course. When placement continues, position the paver on the transverse joint so that sufficient hot mixture will be spread in order to create a joint after rolling that conforms to the required smoothness. If the temperature of the previously placed pavement material drops below 140 degrees F before paving is resumed, give the exposed vertical face a thin coat of liquid asphalt just before paving is continued.
- C. Longitudinal Joints: Coat longitudinal joints that are not completed before the previously laid mixture has cooled to a temperature below 140 degrees F, with liquid asphalt just before paving is continued.

### 3.06 FIELD QUALITY CONTROL

- A. Asphaltic surface and base courses will be randomly cored at minimum rate of 1 core per 20,000 sq. ft of paving. However, a minimum of 3 cores in light duty areas and 3 cores in heavy-duty areas shall be obtained. Coring holes shall be immediately filled with full-depth asphaltic concrete. Asphaltic concrete pavement samples will be tested for conformance with mix design.
- B. Testing will be performed on finished surface of each asphalt concrete course for smoothness, using 10'-0" straightedge applied parallel with, and at right angles to centerline of paved area. Results of failed tests will be sent to Wal-Mart Construction Manager within 24 hours. . Surfaces will not be accepted if the following 10-foot straightedge tolerances for smoothness are exceeded:
- |                         |          |
|-------------------------|----------|
| Base Course Surface:    | 1/4-inch |
| Wearing Course Surface: | 1/8-inch |
- C. Thickness Test: The average thickness of the course or the combined courses shall be within 1/4 inch of the indicated thickness. Where the deficiency is greater than the specified tolerance, remove the pavement and replace it with new pavement.
- D. Field density test for in-place materials shall be performed by examination of field cores in accordance with one of following standards:
1. AASHTO Test Method T 245 (Percent of Laboratory Density)
    - a. Temperature equal to temperature at paving machine with reheating.
    - b. Compactive blows (35, 50, or 75) equal to mix design blows.
    - c. Minimum density = 96% of laboratory density.

2. AASHTO Test Method T 209 (Percent of Theoretical Maximum Density)
  - a. Minimum density = 92% of Theoretical Maximum Density.
- E. Rate of density testing shall be 1 core per 20,000 sq. ft of pavement, with minimum of 3 cores from heavy-duty areas and 3 cores from light duty areas. Cores shall be cut from areas representative of project.
- F. Areas of insufficient compaction, smoothness and thickness shall be delineated, removed, and replaced in compliance with Specifications at no additional expense to Owner.

## SECTION 321218 - BASE COURSE

### PART 1 GENERAL

#### 1.01 SECTION INCLUDES

- A. Construction of granular base for asphaltic concrete and portland cement concrete paving.
- B. Construction of sand/shell base for asphaltic concrete and portland cement concrete paving.
- C. Construction of hot-mix sand asphalt base for asphaltic concrete paving.

#### 1.02 RELATED SECTIONS

- A. Section 312100 - Aggregate Materials
- B. Section 321216 - Asphaltic Concrete Paving
- C. Section 321314 - Portland Cement Concrete Paving
- D. Section 321723 – Pavement Markings
- D. Section 321315 - Curbs and Sidewalks
- E. Construction Drawings

#### 1.04 QUALITY ASSURANCE

- A. An independent testing laboratory, selected and paid by Owner, will be retained to perform construction testing of in-place base course for compliance with requirements for thickness, compaction, density, and tolerances. Paving base course tolerances shall be verified by rod and level readings on not more than 50-foot centers to be not more than 0.05-feet above design elevation which will allow for paving thickness as shown on Construction Drawings. Contractor shall provide instruments and suitable benchmark.
- B. Do not place aggregate when base surface temperature is less than 40 degrees F, nor when air temperature is below 45 degrees F. Do not place aggregate when surface is wet or frozen. Do not place aggregate when weather conditions are unfavorable otherwise.

## **PART 2 PRODUCTS**

### **2.01 FILL MATERIALS**

- A. Submit materials certificate to the independent testing laboratory that is signed by materials producer and Contractor, certifying that materials comply with, or exceed, requirements specified herein or on the Construction Drawings.
- B. Dense Graded Aggregate conforming to NJDOT Standard Specifications Section 901.08 or approved equal.

## **PART 3 EXECUTION**

### **3.01 EXAMINATION**

- A. Contractor shall verify to the Owner in writing that the subgrade has been inspected, tested, and gradients and elevations are correct, dry, and properly prepared in accordance with Section 312000.

### **3.02 CONSTRUCTION**

- A. Perform base course construction in a manner that will drain the surface properly and prevent runoff from adjacent areas from draining onto base course construction.
- B. Compact base material to not less than 98 percent of optimum density as determined by ASTM D 698 (or 95 percent of optimum density, as determined by ASTM D 1557) unless otherwise indicated on Construction Drawings.
- C. Granular Base: Construct to thickness indicated on Construction Drawings. Apply in lifts or layers not exceeding 8-inches, measured loose.
- D. Sand/Shell Base: Construct to thickness indicated on Construction Drawings. Apply in lifts or layers not exceeding 4-inches, measured loose.
- E. Asphalt Institute Type VI, VII, or VIII Mixes for Hot-mix Sand Asphalt Bases: Construct to thickness indicated on Construction Drawings. Apply in lifts or layers not exceeding 3-inches, measured loose.

**3.03 FIELD QUALITY CONTROL**

- A. Field density tests for in-place materials shall be performed in accordance with the following standard:
  - 1. Nuclear Method: ASTM D 2922 (Method B-Direct Transmission)
- B. Base material thickness: Perform 1 test for each 20,000 sq. ft. of in-place base material area.
- C. Base material compaction: Perform 1 test in each lift for each 20,000 sq. ft. of in-place base material area.
- D. The independent testing laboratory will prepare reports that indicate test location, elevation data, and test results. Owner and Contractor shall be provided with copies of the reports within 96 hours of the time the test was performed. In the event that the test results show failure to meet any of the Specifications; Owner and Contractor will be notified immediately by the independent testing laboratory.
- E. The Contractor shall pay for retesting due to failures at no additional expense to Owner. Contractor shall provide free access to the site for testing activities.

#### 1.04 QUALITY ASSURANCE

- A. Establish and maintain required lines and elevations.
- B. Check surface areas at intervals necessary to eliminate ponding areas. Remove and replace unacceptable paving as directed by Owner.

#### 1.05 SUBMITTALS

- A. Submit materials certificate from materials producer and Contractor, certifying that materials comply with, or exceed, requirements specified herein to the Engineering Consultant of Record and the independent testing laboratory for review and approval and within 7 calendar days after receipt of Notice-to-Proceed, submit for approval, certified laboratory test data or manufacturers certificates and data for the following items:
  - 1. Portland cement concrete mix
  - 2. Aggregate gradations
  - 3. Preformed expansion joint filler
  - 4. Field molded/poured sealant
  - 5. Dowel bars
  - 6. Expansion sleeves
  - 7. Tie bars
  - 8. Reinforcing steel bars
  - 9. Welded wire fabric
  - 10. Air entraining admixtures
  - 11. Water-reducing and set-retarding admixtures (if used)

#### 1.06 PROJECT CONDITIONS

- A. Maintain access for vehicular and pedestrian traffic as required for other construction activities. Utilize temporary striping, flagmen, barricades, warning signs, and warning lights as required.

### **PART 2 PRODUCTS**

#### 2.01 MATERIALS

- A. Forms: Steel, wood, or other suitable material of size and strength to resist movement during concrete placement and to retain horizontal and vertical alignment until removal. Use straight forms, free of distortion and defects. Use flexible spring steel forms or laminated boards to form radius bends as required. Coat forms with nonstaining type of coating that will not discolor or deface surface of concrete.

- B. Welded Wire Mesh: Welded plain cold-drawn steel wire fabric, ASTM A 185. Furnish in flat sheets.
- C. Reinforcing Bars: Deformed steel bars, ASTM A 615, Grade 60.
- D. Portland Cement: Shall conform to ASTM C150, Type I
- E. Joint Fillers: Resilient premolded bituminous impregnated fiberboard units complying with ASTM D994, D1751, D2628; FS HH-F-341, Type II, Class A or approved equal.
- F. Joint Sealants: Conforming to ASTM C920, non-priming, pourable, self-leveling polyurethane. Acceptable sealants are Sonneborn "SL1", Sonneborn "SL2", Sonneborn "Sonomeric 1", Sonneborn "Sonomeric 2", Mameco "Vulkem 245", or Woodmont Products "Chem-Caulk" or approved equal.
- G. Aggregate: Shall conform to ASTM C33.
- H. Water: Shall be clean and potable
- I. Dowel Bars: Shall conform to ASTM A615, grade 60, and plain steel bars.
- J. Air Entraining Mixture: Shall conform to ASTM C260 (Sika AER by Sika Corporation, Air Mix by the Euclid Chemical Corporation or approved equal).
- K. Curing Compound: Shall conform to ASTM C309 (Hydrocide by Sonneborn of Rexnord Chemical Products, Inc., and Polyseal 4 in 1 by Chem Masters Corporation or approved equal.
- L. Joint Backup Rods: Shall be CCEVA Rod 100 by E-Poxy Industrials, Inc., Sealtight BACKER ROPE by W.R. Meadows, Inc. or approved equal.

## 2.02 MIX DESIGN AND TESTING

- A. Mix concrete and deliver in accordance with ASTM C94.
- B. Design mix to produce normal weight concrete consisting of Portland cement, aggregate, water-reducing admixture, air-entraining admixture, and water to produce following properties:
  - 1. Compressive Strength: 3,500 psi, minimum at 28 days, unless otherwise indicated on Construction Drawings.
  - 2. Slump Range: 2"-4" for hand placed concrete, 1-1/4" to 3" for machine placed (slipform) concrete
  - 3. Air Entrainment: 5 to 8 percent

## **PART 3 EXECUTION**

### **3.01 PREPARATION**

- A. Proofroll prepared base material surface to check for unstable areas. Paving work shall begin only after unsuitable areas have been corrected and are ready to receive paving.
- B. Remove loose material from compacted base material surface to produce firm, smooth surface immediately before placing concrete.

### **3.02 INSTALLATION**

- A. Form Construction
  - 1. Set forms to required grades and lines, rigidly braced and secured.
  - 2. Install sufficient quantity of forms to allow continuance of work and so that forms remain in place minimum of 24 hours after concrete placement.
  - 3. Check completed formwork for grade and alignment to following tolerances:
    - a. Top of forms not more than 1/8-inch in 10'-0"
    - b. Vertical face on longitudinal axis, not more than 1/4-inch in 10'-0"
  - 4. Clean forms after each use and coat with form release agent as often as required to ensure separation from concrete without damage.
- B. Reinforcement: Fasten reinforcing bars or welded wire fabric (if required) accurately and securely in place with suitable supports and ties. Remove from reinforcement all dirt, oil, loose mill scale, rust, and other substances that will prevent proper bonding of the concrete to the reinforcement.
- C. Concrete Placement
  - 1. Concrete may be mixed and placed when the air temperature in the shade and away from artificial heat is a minimum of 35 degrees F and rising. Hot and cold weather concreting shall be in accordance with ACI 305R and 306R, respectively.
  - 2. Do not place concrete until base material and forms have been checked for line and grade. Moisten base material if required to provide uniform dampened condition at time concrete is placed. Concrete shall not be placed around manholes or other structures until they are at required finish elevation and alignment.
  - 3. Place concrete using methods that prevent segregation of mix. Consolidate concrete along face of forms and adjacent to transverse joints with internal vibrator. Keep vibrator away from joint assemblies, reinforcement, or side forms. Consolidate with care to prevent dislocation of reinforcing, dowels, and joint devices.
  - 4. Deposit and spread concrete in continuous operation between transverse joints, as far as possible. If interrupted for more than 1/2 hour, place construction joint.
- D. Joint Construction: Construct expansion, weakened-plane control (contraction), and construction joints straight with face perpendicular to concrete surface. Construct transverse joints perpendicular to centerline, unless otherwise detailed.

1. Weakened-Plane Control or Contraction Joints: Provide joints at spacing of 15'-0" on centers, maximum each way. Construct control joints for depth equal to at least 1/4 of the concrete thickness, as follows:
    - a. Form tooled joints in fresh concrete by grooving top with recommended tool and finishing edge with jointer.
    - b. Form sawed joints using powered saws equipped with shatterproof abrasive or diamond-rimmed blades. Cut joints into hardened concrete as soon as surface will not be torn, abraded, or otherwise damaged by cutting action.
  2. Construction Joints: Place construction joints at end of placements and at locations where placement operations are stopped for period of more than 1/2 hour, except where such placements terminate at expansion joints. Construct joints using standard metal keyway-section forms.
  3. Transverse Expansion Joints: Locate expansion joints at maximum of 180'-0" on centers, maximum each way unless otherwise shown on the Construction Drawings. Provide premolded joint filler for expansion joints abutting concrete curbs, catch basins, manholes, inlets, structures, sidewalks, and other fixed objects.
  4. Butt Joints: For joints against existing pavement, place 16" long dowels eight inches into holes drilled into center of existing slab. Epoxy dowels into holes with approved epoxy compound. Place dowels prior to concrete placement for new concrete. Dowel spacing to be 24" on center unless otherwise shown on Construction Drawings. Saw joint and fill with joint sealer.
- E. Joint Fillers: Extend joint fillers full-width and depth of joint, and not less than 1/2-inch or more than 1-inch below finished surface where joint sealer is indicated. Furnish joint fillers in 1-piece lengths for full width being placed, wherever possible. Where more than 1 length is required, lace or clip joint filler sections together.
- F. Joint Sealants: Joints shall be sealed with approved exterior pavement joint sealants and shall be installed in accordance with manufacturer's recommendations.

### 3.03 CONCRETE FINISHING

- A. After striking off and consolidating concrete, smooth surface by screeding and floating. Adjust floating to compact surface and produce uniform texture. After floating, test surface for trueness with 10'-0" straightedge. Distribute concrete as required to remove surface irregularities and refloat repaired areas to provide continuous smooth finish.
- B. Work edges of slabs and formed joints with edging tool, rounding edge to 1/2-inch radius. Eliminate tool marks on concrete surface. After completion of floating and trowelling, when excess moisture or surface sheen has disappeared, complete surface finishing, as follows:
  1. Inclined Slab Surfaces: Provide coarse, nonslip finish by scoring surface with stiff-bristled broom perpendicular to flow of traffic so as to produce regular corrugations not over 1/16 of an inch deep.
  2. Paving: Provide coarse, nonslip finish by scoring surface with stiff-bristled broom perpendicular to flow of traffic so as to produce regular corrugations not over 1/16 of an inch deep.

- C. Do not remove forms for 24 hours after concrete has been placed. After form removal, clean ends of joints and point up minor honeycombed areas. Remove and replace areas or sections with major defects, as directed by Owner.
- D. Protect and cure finished concrete paving using acceptable moist-curing methods, more particularly described in "water-curing" section of ACI 308.

**3.04 CLEANING AND ADJUSTING**

- A. Sweep concrete pavement and wash free of stains, discolorations, dirt, and other foreign material just prior to final inspection.
- B. Protect concrete from damage until acceptance of work. Exclude traffic from pavement for at least 14 days after placement. When construction traffic is permitted, maintain pavement as clean as possible by removing surface stains and spillage of materials.

**3.05 FIELD QUALITY CONTROL**

- A. The independent testing laboratory will randomly core pavement at minimum rate of 1 core per 20,000 sq. ft of pavement, with minimum of 3 cores from heavy-duty areas and 3 cores from light duty areas. Core will be tested for thickness and quality of aggregate distribution. Core holes shall be patched immediately with portland cement concrete and shall be finished to provide level surface as specified herein.

**END OF SECTION 321314**

\\langan.com\data\PAR\data2\101053201\Project Data\Specifications\FOR BID\321314 Portland Cement Concrete Paving.docx

## SECTION 321315 - CURBS AND SIDEWALKS

### PART I GENERAL

#### 1.01 SECTION INCLUDES

- A. Preparation and placement of combination portland cement concrete curb and gutter.
- B. Preparation and placement of portland cement concrete curb.
- C. Preparation and placement of portland cement concrete sidewalk.

#### 1.02 RELATED SECTIONS

- A. Section 321218 - Base Course
- B. Section 321216 – Asphaltic Concrete Paving
- C. Section 321723 – Pavement Markings
- D. Construction Drawings

#### 1.03 REFERENCE STANDARDS

- A. American Concrete Institute (ACI) latest edition
  - 1. 211.1 Standard Practice for Selecting Proportions for Normal, Heavyweight, and Mass Concrete
  - 2. 304R Guide for Measuring, Mixing, Transporting, and Placing Concrete
  - 3. 305R Hot Weather Concreting
  - 4. 306R Standard Specification for Cold Weather Concreting
  - 3. 308 Standard Practice for Curing Concrete
- B. American Standards for Testing and Materials (ASTM) latest edition
  - 1. A185 Steel Welded Wire Fabric, Plain, for Concrete Reinforcement
  - 2. A615 Deformed and Plain Billet-Steel for Concrete Reinforcement
  - 3. C33 Concrete Aggregates
  - 4. C78 Method for Flexural Strength Concrete (Using Simple Beam with Third-point Loading)
  - 5. C94 Ready-Mixed Concrete
  - 6. C143 Method for Slump of Hydraulic Cement Concrete
  - 7. C150 Portland Cement
  - 8. C171 Sheet Material for Curing Concrete
  - 9. C231 Air-Content of Freshly Mixed Concrete by the Pressure Method
  - 10. C260 Air-Entraining Admixtures for Concrete
  - 11. C309 Liquid Membrane-Forming Compounds for Curing Concrete
  - 12. C494 Chemical Admixtures for Concrete
  - 13. D994 Preformed Expansion Joint Filler for Concrete (Bituminous)
  - 14. D1190 Concrete Joint Sealer, Hot Poured, Elastic Type

- 15. D1751 Performed Expansion Joint Fillers for Concrete Paving and Structural Construction (Non-extruding and Resilient Bituminous Types)
- 16. D2628 Preformed Polychloroprene Elastomeric Joint Seals for Concrete Pavements

C. State Highway Department Standard Specifications

1.04 QUALITY ASSURANCE

- A. Establish and maintain required lines and elevations.
- B. Check surface areas at intervals necessary to eliminate ponding areas. Remove and replace unacceptable work as directed by Owner.

1.05 SUBMITTALS

- A. Submit materials certificate which materials producer and Contractor, certifying that materials comply with, or exceed, requirements specified herein to the Engineering Consultant of Record and the independent testing laboratory for review and approval for the following items:

With 7 calendar days after receipt of Notice-to-Proceed, submit for approval, certified laboratory test data or manufacturers certificates and data for the following items:

- 1. Portland cement concrete mix
- 2. Aggregate gradations
- 3. Preformed expansion joint filler
- 4. Field molded/poured sealant
- 5. Dowel bars
- 6. Expansion sleeves
- 7. Tie bars
- 8. Reinforcing steel bars
- 9. Welded wire fabric
- 10. Air entraining admixtures
- 11. Water-reducing and set-retarding admixtures (if used)

1.06 PROJECT CONDITIONS

- A. Maintain access for vehicular and pedestrian traffic as required for other construction activities. Utilize temporary striping, flagmen, barricades, warning signs, and warning lights as required.

**PART 2 PRODUCTS**

2.01 MATERIALS

- A. Forms: Steel, wood, or other suitable material of size and strength to resist movement during concrete placement and to retain horizontal and vertical alignment until removal. Use straight forms, free of distortion and defects. Use flexible spring steel forms or laminated boards to form radius bends as required. Forms shall be of depth equal to

depth of curbing or sidewalk, and so designed as to permit secure fastening together at tops. Coat forms with nonstaining type of coating that will not discolor or deface surface of concrete.

- B. Welded Wire Mesh: Welded plain cold-drawn steel wire fabric, ASTM A 185. Furnish in flat sheets.
- C. Reinforcing Steel: Deformed steel bars, ASTM A 615, Grade 60.
- D. Portland Cement: Shall conform to ASTM C150, Type I
- E. Joint Fillers: Resilient premolded bituminous impregnated fiberboard units complying with ASTM D994, D1751, D2628; FS HH-F-341, Type II, Class A or approved equal.
- F. Joint Sealants: Conforming to ASTM D1190, non-priming, pourable, self-leveling polyurethane. Acceptable sealants are Sonneborn "Sonolastic Paving Joint Sealant", Sonneborn "Sonomeric CT 1 Sealant", Sonneborn "Sonomeric CT 2 Sealant", Mameco "Vulken 245", or Woodmont Products "Chem-Caulk" or approved equal.
- G. Aggregate: Shall conform to ASTM C33.
- H. Water: Shall be clean and potable
- I. Dowel Bars: Shall conform to ASTM A615, grade 60, and plain steel bars.
- J. Air Entraining Mixture: Shall conform to ASTM C260 (Sika AER by Sika Corporation, Air Mix by the Euclid Chemical Corporation or approved equal).
- K. Curing Compound: Shall conform to ASTM C309 (Hydrocide by Sonneborn or Rexnord Chemical Products, Inc., and Polyseal 4 in 1 by Chem Masters Corporation or approved equal.
- L. Joint Backup Rods: Shall be CCEVA Rod 100 by E-Poxy Industrials, Inc., Sealtight BACKER ROPE by W.R. Meadows, Inc. or approved equal.

## 2.02 MIX DESIGN AND TESTING

- A. Mix concrete and deliver in accordance with ASTM C94.
- B. Design mix to produce normal weight concrete consisting of Portland cement, aggregate, water-reducing admixture, air-entraining admixture, and water to produce following:
  - 1. Compressive Strength: 4,000 psi, minimum at 28 days, unless otherwise indicated on Construction Drawings.
  - 2. Slump Range: 2"-3" for hand placed concrete, 1-1/4" to 3" for machine placed (slipform) concrete
  - 3. Air Entrainment: 5 to 7 percent

## **PART 3        EXECUTION**

### **3.01    PREPARATION**

- A.     Proofroll prepared base material surface to check for unstable areas. Begin paving work only after unsuitable areas have been corrected and are ready to receive paving.
- B.     Remove loose material from compacted base material surface to produce firm, smooth surface immediately before placing concrete.

### **3.02    INSTALLATION**

- A.     Form Construction
  - 1.     Set forms to required grades and lines, rigidly braced and secured.
  - 2.     Install sufficient quantity of forms to allow continuance of work and so that forms remain in place minimum of 24 hours after concrete placement.
  - 3.     Check completed formwork for grade and alignment to following tolerances:
    - a.     Top of forms not more than 1/8-inch in 10'-0"
    - b.     Vertical face on longitudinal axis, not more than 1/4-inch in 10'-0"
  - 4.     Clean forms after each use and coat with form release agent as often as required to ensure separation from concrete without damage.
- B.     Reinforcement: Fasten reinforcing bars or welded wire fabric (if required) accurately and securely in place with suitable supports and ties. Remove from reinforcement all dirt, oil, loose mill scale, rust, and other substances that will prevent proper bonding of the concrete to the reinforcement.
- C.     Concrete Placement
  - 1.     Concrete may be mixed and placed when the air temperature in the shade and away from artificial heat is a minimum of 35 degrees F and rising. Hot and cold weather concreting shall be in accordance with ACI 305R and 306R, respectively.
  - 2.     Do not place concrete until base material and forms have been checked for line and grade. Moisten base material if required to provide uniform dampened condition at time concrete is placed. Do not place concrete around manholes or other structures until set at required finish elevation and alignment.
  - 3.     Place concrete using methods that prevent segregation of mix. Consolidate concrete along face of forms and adjacent to transverse joints with internal vibrator. Keep vibrator away from joint assemblies, reinforcement, or side forms. Consolidate with care to prevent dislocation of reinforcing, dowels, and joint devices.
  - 4.     Deposit and spread concrete in continuous operation between transverse joints, as far as possible. If interrupted for more than 1/2 hour, place construction joint. Automatic machine may be used for curb and gutter placement. Machine placement shall be at required cross section, line, grade, finish, and jointing as specified for formed concrete. If results are not acceptable, remove and replace with formed concrete as specified herein.
- D.     Joint Construction

1. Contraction Joints: Construct concrete curb or combination concrete curb and gutter, where specified on Construction Drawings, in uniform sections of length specified on Construction Drawings. Form joints between sections either by steel templates, 1/8-inch in thickness, of length equal to width of curb and gutter, and with depth which will penetrate at least 2-inches below surface of curb and gutter; or with 3/4-inch thick performed expansion joint filler cut to exact cross section of curb and gutter; or by sawing to depth of at least 2-inches while concrete is between 4 and 24 hours old. If steel templates are used, they shall be left in place until concrete has set enough to hold it's shape, but shall be removed while forms are still in place.
  2. Longitudinal Construction Joints: Tie concrete curb or combination concrete curb and gutter, where specified on Construction Drawings, to concrete pavement with 1/2-inch round deformed reinforcement bars of length and spacing shown on Construction Drawings.
  3. Transverse Expansion Joints: Concrete curb, combination concrete curb and gutter, or concrete sidewalk shall have filler cut to exact cross section of curb, gutter, or sidewalk. Joints shall be similar to type of expansion joint used in adjacent pavement.
- E. Joint Fillers: Extend joint fillers full-width and depth of joint, and not less than 1/2-inch or more than 1-inch below finished surface where joint sealer is indicated. Furnish joint fillers in 1-piece lengths for full width being placed, wherever possible. Where more than 1 length is required, lace or clip joint filler sections together.
- F. Joint Sealants: Seal joints with approved exterior pavement joint sealants. Install in accordance with manufacturer's recommendations.

### 3.03 CONCRETE FINISHING

- A. After striking off and consolidating concrete, smooth surface by screeding and floating. Adjust floating to compact surface and produce uniform texture. After floating, test surface for trueness with 10'-0" straightedge. Distribute concrete as required to remove surface irregularities, and refloat repaired areas to provide continuous smooth finish.
- B. Work edges of sidewalks, gutters, back top edge of curb, and formed joints with edging tool, rounding edge to 1/2-inch radius. Eliminate tool marks on concrete surface. After completion of floating and trowelling, when excess moisture or surface sheen has disappeared, complete surface finishing, as follows:
1. Curbs, gutters, and sidewalks: Broom finish by drawing fine-hair broom across surface perpendicular to flow of traffic. Repeat operation as necessary to produce fine line texture.
- C. Do not remove forms for 24 hours after concrete has been placed. After form removal, clean ends of joints and point up minor honeycombed areas. Remove and replace areas or sections with major defects, as directed Owner.
- D. Protect and cure finished concrete paving using acceptable moist-curing methods, more particularly described in "water-curing" section of ACI 308.

### 3.04 BACKFILL

- A. After concrete has set sufficiently, spaces on either side of concrete curb, combination concrete curb and gutter, or concrete sidewalk shall be refilled to required elevation with suitable material compacted in accordance with Section 312000.

**3.05 CLEANING AND ADJUSTING**

- A. Sweep concrete pavement and wash free of stains, discolorations, dirt, and other foreign material just prior to final inspection.
- B. Protect concrete from damage until acceptance of work. Exclude traffic from pavement for at least 14 days after placement. When construction traffic is permitted, maintain pavement as clean as possible by removing surface stains and spillage of materials.

**END OF SECTION 321315**

\\\\langan.com\data\PAR\data2\101053201\Project Data\Specifications\FOR BID\321315 Curbs and Sidewalks.docx

## **SECTION 321373 - CONCRETE PAVEMENT JOINT SEALANTS**

### **PART 1 – GENERAL**

#### **1.01 SCOPE OF WORK**

- A. Provide labor, materials, equipment and services, and perform operations required for installation of sealants/site and related work as indicated on the drawings or specified herein.
- B. Work Included: The work of this Section shall include, but not be limited to, the following:
  - 1. Exterior weather joints between similar and dissimilar materials.
  - 2. Exterior horizontal traffic joints.
- C. The words ‘caulking’ and ‘sealant’ shall be considered synonymous on the Contract Documents. It shall be understood that both words define materials for sealing joints or seams watertight.

#### **1.02 QUALITY ASSURANCE**

- A. Materials shall conform to the latest edition of reference specifications listed below, specified herein and to applicable codes and requirements of local authorities having jurisdiction. Work and installation shall conform to ASTM C962.
- B. Qualifications: Installer of sealants shall have a minimum of five (5) years of successful experience in the application of the type of materials specified in this section and only skilled workmen shall be used for the work.

#### **1.03 SUBMITTALS**

- A. Product Data: Copies of manufacturer’s latest published literature for all materials specified herein shall be submitted before materials are delivered to the site.
- B. Schedule of Sealant Usage: Submit a detailed schedule of all locations of sealant usage. List each sealant material, joint filler(s), color(s) and related data for each location of use.

1.04 DELIVERY, STORAGE AND HANDLING

- A. Materials shall be delivered to the site, in original unopened containers, clearly indicating manufacturer's name, brand name, and other identifying information.
- B. Materials shall be stored in a dry location, off the ground and in such a manner as to prevent freezing, damage and the intrusion of foreign matter.
- C. Materials which have become damaged or otherwise unfit for use during delivery, or storage, shall be replaced at the expense of the Contractor.

1.05 PROJECT CONDITIONS

- A. Environmental Conditions: Do not proceed with installation of joint sealers under the following conditions:
  - 1. When ambient and substrate temperature conditions are outside the limits permitted by joint sealer manufacturers.
  - 2. When joint substrates are wet due to rain, frost, condensation, or other causes.
- B. Joint Width Conditions: Do not proceed with installation of joint sealers where joint widths are less than allowed by the joint sealant manufacturer for the application indicated.
- C. Joint Substrate Conditions: Do not proceed with installation of joint sealers until contaminants capable of interfering with their adhesion are removed from joint substrates.
- D. Joint Design: Joint widths indicated within the Contract Documents are detailed at their "Designed Width", which is when the joint would be at the average air temperature of 70 degrees F. Installation shall take into account the ambient temperature range at the time of respective installation and operation.
  - 1. Joint materials shall perform over a ambient air temperature range of 120 degrees F. and a surface temperature range of 180 degrees F.

1.06 WARRANTY

- A. The Contractor shall execute and deliver to the Owner before final payment is made, a written warranty in a satisfactory form, stating that labor and materials furnished, and work performed by the Contractor are in accordance with the Contract Documents and authorized alterations and additions thereto; and that, should any defects develop during the warranty period, the Contractor shall upon written notice from the Architect or Owner, replace or satisfactorily repair such defects, including adjustments to adjacent work, as required; at the convenience of, and without expense to the Owner. Contractor shall warranty work for Five (5) years from date of final acceptance.

## **PART 2 – PRODUCTS**

### **2.01 SEALANT MATERIALS**

- A. General: Provide a complete system of cleaners, primers, fillers, tapes, backer rods and tapes and sealants in accordance with the manufacturer's requirements and the standards specified herein.
  - 1. Color of Sealants: For concealed joints provide manufacturer's standard color which has the best overall performance qualities for the application shown. For exposed joints the Architect will select colors from the manufacturer's standard colors or special colors as specified elsewhere.
- B. Elastomeric Compounds
  - 1. Multi-Component Polyurethane (Sealant Type 1): ASTM C920, class and use as best suited for the intended purpose. Products meeting these requirements are:
    - a. "DYmeric" by Tremco.
    - b. "Dynatrol II by Pecora Corp.
    - c. "Sonolastic NP II" by Sonneborn Building Products.
    - d. Or approved equal.
  - 2. Self-Leveling Traffic Bearing (Sealant Type 2): ASTM C920, self-leveling, two-part polyurethane compound, with a Shore A cured hardness of 35 plus or minus 5. Sealant shall have a joint movement capability of plus/minus 50 percent.
    - a. "Sonolastic 2C SL" by Sonneborn Building Products
    - b. "Sikaflex 12SL" by Sika Corp.
    - c. "Urexpan NR-20 1' by Pecora Corp.
    - d. Or approved equal.

### **2.02 JOINT FILLER MATERIALS**

- A. Compressible Rod (Filler Type 1): Types as shown, or as required for proper performance of the sealant in the specific joint, which is compatible with sealant, as recommended by sealant manufacturer. One of the following:
  - 1. Closed Cell Polyethylene Foam Rod: One of the following:
    - a. "Tremco Joint Backing" (Tremco).
    - b. "Green-Rod Polyethylene Backer Rod" (Nomaco, Inc.).

- c. “HBR Backer Rod” (Hercules, Inc.).
  - d. “Sonofoam Back Rod” (Sonneborn Building Products).
  - e. Or approved equal.
- 2. Open Cell Polyurethane Rod: “Denver Foam” as distributed by Pecora Chemical Corp. or Woodmont Products Inc.
- B. Preformed Sponge Rubber or Cork (Filler Type 2): ASTM D1752, Type I, II or III; type best suited for joint condition.
- C. Closed Cell Neoprene (Filler Type 3): ASTM D1056, Type S, Class SCE.
- D. Closed Cell Polyethylene (Filler Type 5): Not less than 3 psi for 25% compression resistance, highly resistant to petroleum oils and solvents, one of the following:
  - 1. “Expand-O-Foam” (Williams Products, Inc.).
  - 2. “Filler Foam Gasket FF4” (Progress Unlimited Inc.)
  - 3. “Tremco Joint Backing” (Tremco)
  - 4. Or approved equal.
- E. Select shape and size of joint filler in consultation with the manufacturer for proper performance in the specific condition of use in each case.

## 2.03 MISCELLANEOUS MATERIALS

- A. Joint Cleaner: Provide non-staining cleaner recommended by the manufacturer of the sealant for the specific joint surface and condition.
- B. Joint Primer and Sealer: Provide non-staining compounds recommended by the manufacturer of the sealant for the specific joint surface and condition. Primers and cleaners shall not damage applied metal finishes
- C. Bond Breaker Tape: Pressure sensitive polyethylene tape.
- D. Vent Tubes: Vent tubes (weep holes) shall be heat-bendable acrylic tubes.

## **PART 3 – EXECUTION**

### 3.01 EXAMINATION

- A. Examine conditions at the job site where work of this section is to be performed to insure proper arrangement and fit of the work. Start of work implies acceptance of job site conditions.

### 3.02 PREPARATION

- A. Comply with the sealant manufacturers requirements for all preparations.
  - 1. Comply with conditions specified herein before in Paragraph “Project Conditions”.
- B. Clean out joints to receive sealant, backup material or preformed joint filler to comply with recommendations of approved manufacturer and as specified herein.
  - 1. Thoroughly clean joints, removing foreign matter such as dust, oil, grease, water, surface dirt and frost. Sealant must be applied to the base surface. Previously applied paint, film sealers, or coatings shall be entirely removed unless tested and approved by the sealant manufacturer for adhesion.
  - 2. Porous materials such as concrete and masonry shall be cleaned where necessary by grinding, water blast-cleaning, mechanical abrading, or combination of these methods as required to provide a clean, sound base surface for sealant adhesion.
    - a. Clean masonry surfaces with water and air; do not use any acid or other material which might stain surfaces.
    - b. Remove laitance and form release agents from concrete.
    - c. Remove loose particles present or resulting from grinding, abrading or blast-cleaning by blowing out joints with compressed air, oil free or vacuuming joints prior to application of primer or sealant.
  - 3. Clean and remove protective coatings on metallic surfaces as recommended by sealant manufacturer. Clean joint areas protected with masking tape or strippable films as above after removal of tape film.

### 3.03 INSTALLATION

- A. Comply with the sealant manufacturers requirements for all preparations.
  - 1. Comply with conditions specified herein before in Paragraph “Project Conditions
  - 2. Do not begin sealant operations if the work does not in comply with Contract Documents and the sealant manufacturer’s recommendations.
- B. Joint Fillers: Install joint fillers beneath all sealants.
  - 1. Perform work in strict accordance with manufacturer’s instructions.
  - 2. Employ mechanics skilled in this trade and proficient in the installation of specified sealant materials.
  - 3. Install joint filler materials when temperature is between 25 degrees F and 95 degrees F.
  - 4. For facade and traffic bearing conditions, foam sealant shall be at compression of 25 percent of uncompressed dimension. Depth of joint seal shall be in accordance

with manufacturer's requirements. Prior to installation, size of joint and sizing of seal shall be reviewed having regard to ambient temperature and expected thermal movement.

C. Sealants

1. Prime joint substrates where recommended by joint sealer manufacturer based upon the completion of a preconstruction joint sealer-substrate tests or prior experience. Apply primer to comply with joint sealer manufacturer's recommendations. Confine primers to areas of joint sealer bond, do not allow spillage or migration onto adjoining surfaces or exposed surfaces.
2. Use masking tape or other materials to prevent contact of sealant with adjoining surfaces which otherwise would be permanently stained or damaged by such contact or by cleaning methods required to remove sealant smears. Remove as soon as possible after tooling sealant without disturbing joint seal.
3. In joints where depth of joint exceeds required depth of sealant, install joint backing (after primer is dry) in joints to provide backing and proper joint shape for sealant. Proper shape for sealant is a very slight concave curvature. Use special blunt T-shaped tool or roller to install joint backing to the proper and uniform depth required for the sealant. Joint backing shall be installed with approximately 30 percent compression. Do not stretch, twist, braid, puncture, or tear joint backing: Butt joint backing at intersections.
4. Install bond breaker smoothly over surfaces that would bond to sealant and at back of joints where joint backing is not required, so that sealant adheres only to the sides of the joint and not back surfaces nor backing.
5. It is recommended that sealant be installed when the average daily air temperature is 70 degrees F (plus/minus 5 degrees F), when joint should be at its Designed Width. When average daily temperature is lower or higher than this range Contractor shall perform work in strict accordance with sealant manufacturer's recommendations.
6. Apply sealant in accordance with the manufacturer's application manual and manufacturer's instructions, using hand guns or pressure equipment, on clean, dry, properly prepared substrates. Sealant application shall be such to ensure complete contact and adhesion to sides of joints. Temperature of sealant, as well as of substrates, at time of sealant application, shall be as recommended by sealant manufacturers. Refer to Paragraph "Job Conditions". Force sealant into joint in front of the tip of the "caulking gun" (not pulled over it) and force sealant against sides to make uniform contact with sides of joint and to prevent entrapped air or pulling of sealant off of sides. Fill sealant space solid with sealant.
7. Tool exposed joints to form smooth and uniform beds, with slightly concave surface. Finished joints shall be straight, uniform, smooth and neatly finished. Remove masking tape immediately after tooling of sealant and before sealant face starts to "skin" over. Neatly remove any excess sealant from adjacent surfaces of joint, leaving the work in a neat, clean condition.

**3.04 LOCATIONS OF USE**

- A. Sealants: Provide sealants in accordance with the following locations of use:
  - 1. Provide Sealant (Type 1) for all exterior weather seals and movement joints.
  - 2. Provide Sealant (Type 2) for all exterior paving joints.
- B. Joint Filler Materials: Provide joint fillers or tapes at all locations of sealant use as follows:
  - 1. Provide backer rods (Filler Type 1) at all joints to be sealed.
  - 2. Provide backer rods and joint fillers behind all horizontal joints and horizontal lengths of joints.
  - 3. Provide bond breaker tape at all joints indicated on the Drawings to have no backer rod and at joints as required by the sealant manufacturer.

**3.05 FIELD QUALITY CONTROL**

- A. Work under this section shall be subject to detailed inspection. Any sealants found out of plumb or cracking or backer rod or joint fillers found out of plumb or displaced by caulking operations or any work otherwise defective, or work not in accordance with specifications and details, shall be taken out and replaced to the complete satisfaction of the Architect, at no additional cost to the Owner.

**3.06 CLEANING AND PROTECTION**

- A. Upon completion of the work, unused materials, containers, equipment, masking tape or protective measures, etc., shall be removed from the site. Floors, walls and other adjacent surfaces, that are stained or damaged by work of this section, shall be repaired and adjacent surfaces shall be left in a clean and undamaged condition.
- B. Protect joint sealers during and after curing period from contact with contaminating substances or from damage resulting from construction operations or other causes so that they are without deterioration or damage at time of Substantial Completion. If, despite such protection, damage or deterioration occurs, cut out and remove damaged or deteriorated joint sealers immediately and reseal joints with new materials to produce joint sealer installations with repaired areas indistinguishable from original work.

\\\\langan.com\data\par\data2\101053201\project data\specifications\for bid\321373 concrete pavement joint sealants.doc

**END OF SECTION 321373**

## SECTION 321723 - PAVEMENT MARKINGS

### PART 1 GENERAL

#### 1.01 SCOPE OF WORK

This work shall consist of applying or removing white or yellow traffic paint and glass beads on bituminous concrete and Portland cement concrete pavement.

Removal of traffic stripes and markings consists of the removal of white or yellow stripes or solid areas, letters, arrows, and other symbols from bituminous concrete and Portland cement concrete surfaces.

- A. Pavement Stripes or Markings
- B. Surface Preparation
- C. Opening to Traffic
- D. Removal of Traffic Stripes or Traffic Paint

#### 1.02 RELATED SECTIONS AND DOCUMENTS

- A. Section 321724 – Traffic Control Signage

#### 1.03 REFERENCES

- A. Reference to the New Jersey Department of Transportation, Standard Specifications for Road and Bridges Construction 1996.

### PART 2 PRODUCTS

#### 2.01 MATERIALS

All pavement striping and markings on temporary on-site roadway and parking areas shall be Latex Traffic Paint. All striping on permanent on-site roadway and parking areas shall be Epoxy Resin stripes. All pavement markings on permanent on-site roadway and parking areas shall be Thermoplastic markings.

- A. Pavement Stripes or Markings Paint
  - 1. Latex Traffic Paint. Latex traffic paint for traffic stripes or traffic marking shall be white or a yellow ready-mixed pigmented binder which is emulsified in water and capable of anchoring reflective glass beads which are separately applied. In addition the paint shall not contain any of the materials listed in the EPA code of regulations (CFR) 40, section 261.24 Table 1.

Manufactures of latex paint shall have produced, to the satisfaction of the Department's Bureau of Materials, a fast-drying traffic paint, which meets the following requirements:

- a. Composition

- b. Pigment
- c. Nonvolatile Vehicle
- d. Physical Properties
  - 1) Color
  - 2) Organic Volatile
  - 3) Volume of Solids
  - 4) Total Solid
  - 5) Liter Weight
  - 6) Grind
  - 7) Field No-Tracking Time
  - 8) Viscosity
  - 9) Flexibility
  - 10) Dry Opacity
  - 11) Daylight Reflectance
  - 12) Abrasion Resistance
  - 13) Water Resistance
  - 14) Freeze-Thaw Stability
  - 15) Heat Stability
  - 16) Dilution Test
  - 17) Dry Through (Early Washout)
  - 18) Color Appearance After Aging
  - 19) Shelf Life
  - 20) Packaging

2. Alkyd Traffic Paint. Alkyd traffic paint for traffic stripes or traffic markings shall be a white or a yellow ready-mixed pigmented binder which is a solvent-borne, high solid, lead free formulation capable of anchoring reflective glass beads which are separately applied. The paint shall not contain methylene chloride or 1,1,1-trichloroethane.

Manufacturers of alkyd paint shall have produce, to the satisfaction of the Department's Bureau of Materials, a fast-drying traffic paint, which meets the following requirements:

- a. Composition
- b. Pigment
- c. Vehicle
- d. Physical Properties
  - 1) Color
  - 2) Organic Volatile
  - 3) Total Solids
  - 4) Liter Weight
  - 5) Grind
  - 6) Drying Time
  - 7) Viscosity
  - 8) Flexibility
  - 9) Dry Opacity
  - 10) Daylight Reflectance
  - 11) Abrasion Resistance
  - 12) Water Resistance

- 13) Bleeding Resistance
- 14) Heat Stability
- 15) Color Appearance After Aging
- 16) Shelf Life
- 17) Packaging

B. Long-Life Epoxy Resin Traffic Stripes.

Epoxy resin compound shall be specifically formulated for use as a long-life pavement striping material and for hot-spray application at elevated temperature. Long-life epoxy resin traffic stripes placed on the project with material that fails to comply with the following requirements shall be removed and replaced according to Subsection 618.10:

2.02 EQUIPMENT

The epoxy striping until shall be so designed, equipped, maintained, and operated that the material is properly applied in variable widths at consistent temperature. The equipment for applying thermoplastic material shall be capable of providing continuous mixing and agitation of the material. All equipment for applying traffic stripes or traffic markings shall be equipped with glass bead dispensers of a type that will mechanically and automatically dispense beads uniformly on wet stripes or markings at the rates specified.

Equipment for removing the various types of traffic stripes or traffic markings shall be designed with a vacuum system to remove all millings from the pavement surface and prevent airborne residue from escaping into the atmosphere.

**PART 3 EXECUTION**

3.01 SURFACE PREPARATION

Contractor shall remove, immediately prior to striping or marking the pavement surface, all dirt, oil, grease, existing types of traffic stripes or traffic marking, and other foreign material, including curing compound on new Portland cement concrete, from the surface areas on which the various traffic stripes or traffic marking are to be placed. The pavement shall be cleaned 25 millimeters beyond the perimeter of where the stripe or marking is to be placed.

Contractor shall apply a primer-sealer conforming to NJDEP volatile organic content (VOC) requirements to the area of bituminous concrete surface, when recommended by the manufacture, and to the areas of Portland cement concrete surfaces where long-life thermoplastic traffic marking are to be placed.

3.02 APPLYING PAINT AND BEADS

Latex Traffic Paint. Contractor shall apply latex traffic stripes or traffic marking when the ambient and surface temperatures are above 7 degree C and rising. The Latex traffic paint shall be applied in a wet film thickness of  $150 \pm 25$  micrometers where traffic stripes are required for 14 days or less. The traffic paint shall be applied in a wet film thickness of  $380 \pm 25$  micrometers where traffic stripes or traffic stripes or marking are to be visible to traffic 15 days and beyond, or

when stripes or markings are to be placed on intermediate pavement layers to be opened to traffic due to stage construction.

Contractor shall apply glass beads, according to the gradation specified for latex traffic paint, to the wet paint in a uniform pattern and at the rate of for latex traffic paint, to the wet paint in a uniform pattern and at the rate of 1.4 kilograms per liter of paint.

When traffic stripes or traffic markings are required to remain visible beyond 14 days, Contractor shall apply, prior to acceptance and when directed, additional applications of latex traffic paint and glass beads. These applications shall be applied at least 15 days after the initial application and after any sawing or sealing of joints in the bituminous concrete overlay.

Alkyd Traffic Paint. Contractor shall apply alkyd traffic stripes or traffic marking when the ambient and surface temperatures are between 2 and 7 degree C and rising. The alkyd traffic paint shall be applied in a wet film thickness of  $150 \pm 25$  micrometers where traffic stripes are required for 14 days or less. The traffic paint shall be applied in a wet film thickness of  $280 \pm 25$  micrometers where traffic stripes or traffic stripes or marking are to be visible to traffic 15 days and beyond, or when stripes or markings are to be placed on intermediate pavement layers to be opened to traffic due to stage construction.

Contractor shall apply glass beads, according to the gradation specified for alkyd traffic paint, to the wet paint in a uniform pattern and at the rate of for alkyd traffic paint, to the wet paint in a uniform pattern and at the rate of 0.7 kilograms per liter of paint.

When traffic stripes or traffic markings are required to remain visible beyond 14 days, Contractor shall apply, prior to acceptance and when directed, additional applications of latex traffic paint and glass beads. These applications shall be applied at least 15 days after the initial application and after any sawing or sealing of joints in the bituminous concrete overlay.

Long-Life Epoxy Resin Traffic Stripes. Contractor shall mix epoxy resin material with an automatic proportioning and mixing machine and hot-spray the compound at a temperature between 38 and 55 degree C onto thoroughly dry surface. The material shall only be placed during anticipated dry weather when the ambient temperature is a minimum of 7 degree C and the surface temperature is a minimum of 10 degree C. The temperature of the sprayed mixture shall be adjusted as required for prevailing conditions, including the air and pavement surface temperatures, to achieve a no-track drying time of 30 minutes or less. The epoxy resin mixture shall be applied in a wet film thickness of  $500 \pm 25$  micrometers.

Immediately after, or in conjunction with the epoxy resin application, Contractor shall apply large glass beads and small glass beads to the wet compound. Each type of beads shall be applied in a uniform pattern and each at a rate of 1.4 kilograms per liter of epoxy resin material.

Contractor shall remove all epoxy resin material that has been tracked or spilled in areas outside the intended placement areas.

Long-Life Thermoplastic Traffic Marking. Contractor shall apply either performed or hot extruded thermoplastic traffic markings using equipment and procedures that produce markings that are straight and have sharp edges; that are the specified color, width, and thickness; that have uniform retroreflectivity; and that are properly bonded to the pavement. The thermoplastic material shall be applied as follows:

1. Preformed Thermoplastic. Contractor shall place preformed thermoplastic traffic marking tape on thoroughly dry surfaces and during anticipated dry weather. The preformed thermoplastic tape shall be melted using the flame from a propane-type torch, according to the manufacturer's recommendations, to bond the traffic marking permanently in position.

If required, Contractor shall apply additional glass beads to the hot-wet material in a uniform pattern, to attain the minimum initial retroreflectance value specified in subsection 618.10 for thermoplastic tape.

2. Extruded Thermoplastic. Contractor shall heat the thermoplastic material uniformly and apply the melted material at a temperature between 205 and 220 degree C, to thoroughly dry surface and during anticipated dry weather, when the ambient and surface temperature are a minimum of 10 degree C. The thermoplastic traffic marking shall be extruded on the bituminous or Portland cement concrete pavement in a thickness of 2.3 millimeters.

Immediately after, or in conjunction with the thermoplastic application, Contractor shall apply, by mechanical means, glass beads to the wet material in a uniform pattern and a minimum rate of 0.5 kilogram per square meter of marking. Hand throwing of the beads will not be allowed.

### 3.03 OPENING TO TRAFFIC

Contractor shall complete each application of all types of traffic stripes or traffic markings and allows them to thoroughly dry before opening to traffic.

Should ambient and surface temperatures be below the minimums specified for various material, with approval, traffic stripes or traffic markings may be placed at temperatures as low as 2 degree C in order to open the traveled way to traffic. Placement of long-life epoxy resin or thermoplastic may be delayed for up to four days after paving.

As a minimum, center lines on undivided roadways and broken lines between lanes shall be delineated before the traveled way is opened. Unless directed, temporary pavement markers shall be used for the interim delineation until permanent stripes and markings are applied. Engineer will determine when the traveled way is to be opened to traffic.

### 3.04 REMOVAL OF TRAFFIC STRIPES OR TRAFFIC PAINT

Contractor shall remove all types of traffic stripes or traffic markings by methods that do not damage the integrity of the underlying pavement or adjacent pavement areas, and that do not cause gouging, or create ridges or grooves in the pavement that may result in compromising vehicular control. Obliterating stripes or markings by painting over them will not be permitted.

Before starting removal operations, Contractor shall demonstrate the proposed method to accomplish the removal of approximately 95 percent of the stripe or marking without the removal of more than 2 milliliters of pavement thickness. Area of removal includes the area of the stripe or marking plus 25 milliliters on all sides. Removal operations will not be permitted until the method have been approved.

Contractor shall replace all existing pavement reflectors that have been damaged by removal operations, at no cost to the State.

Debris from the removal of traffic stripes and markings shall be disposed of in accordance with subsection 201.10.

## SECTION 323113 - CHAIN LINK FENCES AND GATES

### PART I GENERAL

#### 1.01 SECTION INCLUDES

- A. Installation of chain link fences and gates units provided by single source including erection accessories, fittings, and fastenings.
- B. Refer to architectural building plans for fencing attached to building.

#### 1.02 RELATED SECTIONS

- B. Construction Drawings

#### 1.03 REFERENCE STANDARDS

- A. American Society for Testing and Materials (ASTM) latest edition
  - 1. A 116 Zinc-Coated (Galvanized) Steel Woven Wire Fence Fabric
  - 2. A 120 Pipe, Steel, Black and Hot-Dipped Zinc Coated (Galvanized) Welded and Seamless, for Ordinary Uses
  - 3. A 121 Zinc-Coated (Galvanized) Steel Barbed Wire
  - 4. A 123 Zinc (Hot Dip Galvanized) Coatings on Iron and Steel Products
  - 5. A 153 Zinc Coating (Hot-Dip) on Iron and Steel Hardware
  - 6. A 392 Zinc-Coated Steel Chain-Link Fence Fabric
  - 7. A 428 Weight of Coating on Aluminum-Coated Iron or Steel Articles
  - 8. A 491 Aluminum-Coated Steel Chain Link Fence Fabric
  - 9. A 569 Steel, Carbon (0.15 Maximum, Percent), Hot-Rolled, Sheet and Strip Commercial Quality
  - 10. A 585 Aluminum Coated Steel Barbed Wire
  - 11. C 94 Ready-Mixed Concrete
  - 12. F 668 Polyvinyl Chloride (PVC) Coated Steel Chain Link Fence Fabric
  - 13. F 567 Installation of Chain-Link Fence
  - 14. F 573 Residential Zinc-Coated Steel Chain Link Fence Fabric
- B. Chain Link Fence Manufacturers Institute (CLFMI) latest edition Product Manual

#### 1.04 PROJECT RECORD DOCUMENTS

- A. Accurately record actual locations of property perimeter posts relative to property lines and easements.

**2.01    ACCEPTABLE MANUFACTURERS**

- A.    Subject to compliance with requirements, provide products of one of following:
  - 1.    Allied Tube and Conduit Corp.
  - 2.    Anchor Fence, Inc.
  - 3.    United States Steel
  - 4.    Or approved equal.

**2.02    MATERIALS**

- A.    Fabric:
  - 1.    No. 9 gage, 0.148"  $\pm$  0.00", finished size galvanized steel wires, 2-inch mesh, top and bottom selvages twisted and barbed conforming to ASTM A392, A491, F668, or F573.
  - 2.    Furnish 1-piece fabric widths for fencing.
- B.    End, Corner, and Pull Posts: Galvanized steel, minimum sizes and weights conforming to ASTM A120 as follows:
  - 1.    Up to 6'-0" Fabric Height: 2.5" pipe (2.375-inch OD), 3.12-pounds per lineal foot, or 3.5-inch x 3.5-inch roll-formed section, 4.85-pounds per lineal foot.
  - 2.    Over 6'-0" Fabric Height: 3.0" pipe (2.875-inch OD), 4.85-pounds per lineal foot, or 3.5-inch x 3.5-inch roll-formed section, 4.85-pounds per lineal foot.
- C.    Line Posts: Galvanized steel, minimum sizes and weights conforming to ASTM A120 as follows:
  - 1.    Up to 6'-0" Fabric Height: 2.0" pipe (1.90-inch OD), 2.28pounds per lineal foot or 1.875-inch x 1.625-inch C-section, 2.28-pounds per lineal foot.
  - 2.    Over 6'-0" to 8'-0" Fabric Height: 2.5" pipe (2.375-inch OD), 3.12-pounds per lineal foot or 2.25-inch x 1.875-inch H-section, 2.64-pounds per lineal foot.
  - 3.    Over 8'-0" Fabric Height: 3.0" pipe (2.875-inch OD), 4.85-pounds per lineal foot or 2.25-inch x 1.875-inch H-section, 3.26-pounds per lineal foot.
- D.    Gate Posts: Galvanized steel posts for supporting single gate leaf or 1 leaf of double gate installation, for nominal gate widths conforming to ASTM A120 as follows:
  - 1.    Up to 6'-0": 3.0" pipe (2.875-inch OD), 4.85-pounds per lineal foot, or 3.5-inch x 3.5-inch roll-formed section, 4.85-pounds per lineal foot.
  - 2.    Over 6'-0" to 13'-0": 4.00-inch OD pipe, 9.11-pounds per lineal foot.
- E.    Top Rail: Rails: 10" (1.66-inch OD), 1.84-pounds per lineal foot or 1.625-inch x 1.25-inch roll-formed sections, 1.35 -pounds per lineal foot; galvanized steel, manufacturer's longest lengths conforming to ASTM A120.
- F.    Couplings: Expansion type, approximately 6-inches long, for each joint.
- G.    Attaching Devices: Provide means for attaching top rail securely to each gate corner, pull, and end post.
- H.    Sleeves: Galvanized steel pipe not less than 6-inches long with inside diameter not less than 1/2-inch greater than outside diameter of pipe. Provide steel plate closure welded to

bottom of sleeve of width and length not less than 1-inch greater than outside diameter of sleeve.

- I. Tension Wire: 7 gage galvanized steel, coated coil spring wire, located at bottom of fabric conforming to ASTM A116.
- J. Wire Ties: Class 1 galvanized steel, no less than 9 gage.
- K. Post Brace Assembly: Manufacturer's standard adjustable brace at end of gate posts and at both sides of corner and pull posts, with horizontal brace located at mid-height of fabric. Use same material as top rail for brace, and truss to line posts with 0.375-inch diameter rod and adjustable tightener.
- L. Post Tops: Galvanized steel, weather tight closure cap for each tubular post. Furnish caps with openings to permit passage of top rail.
- M. Stretcher Bars: Galvanized steel, 1 piece lengths equal to full height of fabric, with minimum cross-section of 3/16-inch x 3/4-inch. Provide 1 stretch bar for each gate and end post, and 2 for each corner and pull post.
- N. Stretch Bar Bands: Manufacturer's standard
- O. Gate Cross-bracing: 3/8-inch diameter galvanized steel adjustable length truss rods.
- P. Ready Mix Concrete: ASTM C94, mix design as follows:
  - 1. Mix concrete and deliver in accordance with ASTM C94.
  - 2. Design mix to produce normal weight concrete consisting of Portland cement, aggregate, water-reducing admixture, air-entraining admixture, and water to produce following:
    - a. Compressive Strength: 3,500 psi, minimum at 28 days, unless otherwise indicated on Construction Drawings.
    - b. Slump Range: 1 to 3-inches at time of placement
    - c. Air Entrainment: 5 to 8 percent
- Q. Water: Clean
- R. Swinging Gate Hardware:
  - 1. Hinges: Size and material to suit gate size, non-lift-off type, offset to permit full 180 degree gate opening. Provide a pair of 1 1/2-inch hinges for each leaf over 6'-0" nominal height.
  - 2. Latch: Forked type or plunger-bar type to permit operation from either side of gate, with padlock eye as integral part of latch.
- S. Double Gates Hardware: Provide gate stops for double gates, consisting of mushroom type of flush plate with anchors set in concrete, to engage center drop rod or plunger bar. Include locking device and padlock eye as integral part of latch, using 1 padlock for locking both gate leaves.

- T. Sliding Gate Hardware: Provide manufacturer's standard heavy-duty track, ball-bearing hanger sheaves, overhead framing and supports, guides, stays, bracing, and accessories as required.

### **PART 3 EXECUTION**

#### **3.01 GATE FABRICATION**

- A. Fabricate swing gate perimeter frames of 1.90-inch OD pipe, galvanized steel. Provide horizontal and vertical members to ensure proper gate operation and attachment of fabric, hardware, and accessories. Space frame members maximum of 8'-0" apart.
- B. Assemble gate frames by welding or special fittings and rivets, for rigid connections. Install same fabric as for fence with stretcher bars at vertical edges. Install diagonal cross-bracing on gates as required ensuring rigid frame without sag or twist. Bars may be used at top and bottom edges. Attach stretchers to gate frame at 15-inches o.c. maximum.
- C. Attach hardware to provide security against removal or breakage.

#### **3.02 FINISH**

- A. Fabric Finish: Galvanized, ASTM A 392, Class I, with not less than 1.2 oz zinc/sq. ft of surface.
- B. Framing: Galvanized steel, ASTM A120 or A123, with not less than 1.8 oz zinc/sq. ft of surface.
- C. Hardware and Accessories: Galvanized, ASTM A153 with zinc weights in accordance with Table I.

#### **3.03 CONCRETE MIXING**

- A. Mix materials to obtain concrete with minimum 28-day compressive strength of 2,500 psi; 1-inch maximum size aggregate, maximum 3-inch slump, and 2 - 4 percent entrained air.

#### **3.04 INSTALLATION**

- A. Comply with recommended procedures and instructions of fencing manufacturer. Provide secure, aligned installation with line posts spaced at 10'-0" o.c. maximum.
- B. Grade Set Posts: Drill or hand excavate using posthole digger in firm undisturbed or compacted soil.
- C. Excavate hole for each post to minimum diameter recommended by fence manufacturer but not less than 4 times the largest cross-section of post. Excavate hole depths not less than 36-inches below finish grade surface.
- D. Center and align posts in holes with bottom of posts 3-inches above bottom of excavation.

- E. Place concrete around posts and vibrate or tamp for consolidation. Check each post for vertical and top alignment, and hold in position during placement and finishing operations. Extend concrete footing 2-inches above grade and trowel crown to shed water.
- F. Sleeve Set Posts: Anchor posts by means of pipe sleeves preset and anchored into concrete. After posts have been inserted into sleeves, fill annular space between post and sleeve solid with nonshrink, non-metallic grout, mixed and placed to comply with grout manufacturer's directions.
- G. Top Rails: Run rail continuously, bending to form radius for curved runs. Provide expansion couplings as recommended by manufacturer.
- H. Center Rails: Provide center rails where indicated. Install in 1 piece between posts and flush with post on fabric side, using special offset fittings where necessary.
- I. Brace Assemblies: Install braces so posts are plumb when diagonal rod are under proper tension.
- J. Tension Wire: Install tension wires through post cap loops before stretching fabric and tie to each post cap with not less than 6 gauge galvanized wire. Fasten fabric to tension wire using 11 gauge galvanized steel hog rings spaced 24-inches o.c.
- K. Fabric: Leave approximately 2-in. between finish grade and bottom selvage. Pull fabric taut and tie to posts, rails, and tension wires. Install fabric on security side of fence, and anchor to framework so that fabric remains in tension after pulling force is released.
- L. Stretcher Bars: Secure at end, corner, pull, and gate posts by threading through or clamping to fabric at 4-inches o.c., and secure to posts with metal bands spaced at 15-inches o.c.
- M. Tie Wires:
  - 1. Use U-shaped wire, conforming to diameter of pipe to which attached, clasping pipe and fabric firmly when ends twisted at least 2 full turns. Bend ends of wire to minimize hazard to persons or clothing.
  - 2. Tie fabric to line posts with wire ties spaced 12-inches o.c. Tie fabric to rails and braces with wire ties spaced 24-inches o.c. Tie fabric to tension wires with hog rings spaced 24-inches o.c.
  - 3. Manufacturer's standard procedure will be accepted if of equal strength and durability.
- N. Fasteners: Install nuts for tension bands and hardware bolts on side of fence opposite fabric side. Peen ends of bolts or score threads to prevent removal of nuts.
- O. Gates: Install gates plumb, level, and secure for full opening without interference. Install ground-set items in concrete for anchorage. Adjust hardware for smooth operation and lubrication.

### 3.05 MISCELLANEOUS INSTALLATION

- A. Use U-shape tie wires, conforming to the diameters of pipe, that clasp the pipe and fabric firmly with ends twisted at least 2 full turns.
  - 1. Bend ends of exposed wires to minimize hazards to persons or clothing.

2. Install nuts for fasteners on tension bands and hardware bolts on the side of the fence opposite the fabric. The ends of bolts, once secure and checked for smooth operation, shall be peened to prevent removal of nuts.
3. Repair coatings damaged in the field with methods and techniques as recommended by the manufacturer.

**3.06 WARRANTY**

1. A guarantee shall be furnished for all materials, installation, and workmanship to be free of defects for a period of 1 year from date of acceptance unless noted otherwise in the contract documents. Any defect in installation or workmanship shall be repaired, and defective materials shall be replaced during the guarantee period without any cost to the Owner.

**END OF SECTION 323113**

\\langan.com\data\PAR\data2\101053201\Project Data\Specifications\FOR BID\323113 Chain Link Fences and Gates.docx

## SECTION 323201 - CAST-IN-PLACE CONCRETE WALLS

### PART 1 - GENERAL

- A. The work covered in this Chapter shall include the construction of reinforced concrete retaining walls, only in the case that this wall type is selected for construction from the list of deduct/alternates.

#### 1.02 RELATED SECTIONS

- A. 31116.13 – Concrete Form Liners for Exterior Improvements
- B. 320523 – Cast In Place Concrete for Exterior Improvements
- C. 320522 – Concrete Reinforcing for Exterior Improvements

#### 1.03 REFERENCE STANDARDS

- A. ASTM C 90-75- Standard Specification for Loadbearing Concrete Masonry Units.
- B. ASTM C 140-75 - Standard Specification for Sampling and Testing Concrete Masonry Unit and Related Units
- C. ASTM D 638 - Standard Test Method for Tensile Properties of Plastic.
- D. ASTM D 1248 - Standard Specifications for Polyethylene Plastics Molding and Extrusion Materials, for Wire and Cable.

#### 1.04 REINFORCEMENT

- A. Reinforcement steel shall be free from excess rust, scale or other substances and shall be protected at all times from damage. All reinforcements shall be placed in the exact position shown in the plans, and shall be held securely in position by suitable means so they will not displace during the process of depositing or consolidating the concrete.

#### 1.05 FORMS

- A. Forms shall be of suitable material and of a type, size, shape, quality, and strength to insure construction as designed. The forms shall be true to line and grade, mortar tight, and sufficiently rigid to resist deflection during placing of the concrete. The responsibility for their adequacy shall rest with the Contractor. All dirt, chips, sawdust, nails, and other foreign matter shall be removed completely from forms before any concrete is deposited therein. The surfaces of forms shall be smooth and free from irregularities, dents, sags, and holes that would deface the finished surfaces. Forms previously used shall be thoroughly cleaned of all dirt, mortar, and foreign matter before being reused. Before concrete is placed in forms, all inside surfaces of the forms shall be thoroughly treated with an approved releasing agent which will leave no objectionable film on the surface of the forms that can be absorbed by the concrete. Care shall be exercised that no releasing agent is deposited on previously placed concrete.

#### 1.06 RELATED SECTIONS

- A. Section 320521 - Concrete Forming for Exterior Improvements
- B. Section 320522 - Concrete Reinforcing for Exterior Improvements
- C. Section 320523 - Cast-In-Place Concrete For Exterior Improvements
- D. Section 320524 - Portland Cement Concrete For Exterior Improvements.

## **PART 2 - EXECUTION**

### **2.01 CONCRETE PLACEMENT**

- A. Before placing any concrete, all dirt and other debris shall be removed from the forms. Concrete shall be handled by methods which will prevent the separation or loss of ingredients and the formation of laitance. Concrete free fall distance shall not exceed 5 feet. This includes free fall in a discharge pipe when using a conveyor system for placement. Pumped concrete is not considered in free fall until the concrete exits the pumper hose. The concrete shall be placed in its final position, as nearly as possible, to avoid re-handling. The concrete shall be placed and thoroughly consolidated in level layers not exceeding 12 inches in thickness. Suitable means shall be provided to permit concrete to be placed in a manner which will avoid accumulations of dry or hardened concrete on the forms or reinforcement.

### **2.02 VIBRATING**

- A. All concrete shall be thoroughly consolidated by means of approved mechanical vibrators. The vibrator shall consolidate the full depth and width of the concrete to a uniform mass without segregation. Care must be exercised to insure the coating of all surfaces of the reinforcement with concrete and the thorough consolidation of concrete around the reinforcement. Equal care shall be taken to insure that all concrete is consolidated against the face of the forms.

### **2.03 SURFACE FINISH**

- A. All concrete knee and seat walls shall be finished with a broom finish on exposed surfaces.

### **2.04 JOINTS**

- A. Joints shall be square and normal to the forms unless otherwise provided. Bulkheads shall be provided for all except horizontal joints. When shown in the plans or specified in the Special Provisions, joints shall be sealed.

### **2.05 CONSTRUCTION JOINTS**

- A. Construction joints shall consist of the joints in which no provision is made for movement of abutting surfaces. All construction joints shall be keyed and shall be made only where located in the plans, unless otherwise provided in these Specifications and approved by the Owner's Representative. When not detailed in the plans, or in case of emergency, construction joints shall be placed as directed by the Owner's Representative.

### **2.06 CURING AND PROTECTION**

- A. As soon after the completion of the specified finishing operation as the condition of the concrete will permit without danger of consequent damage thereto, all exposed surface shall be cured by the water method, the form-in-place method, or by the membrane curing compound method.
- B. Form-In-Place Method
- C. Formed surfaces of concrete may be cured by retaining the forms in place. The forms shall remain in place for a minimum period of seven (72) hours after the concrete has been placed.

**END OF SECTION 323201**

## SECTION 323300 - SITE FURNISHINGS

### PART 1 - GENERAL

#### 1.1 RELATED DOCUMENTS

- A. Related Sections include the following:
  - 1. Division 32 Section 321314 "Portland Cement Concrete Paving"
  - 2. Division 32 Section 321315 "Curbs and Sidewalks"
  - 3. Division 32 Section 321373 "Concrete Pavement Joint Sealants"

#### 1.2 SUMMARY

- A. This Section includes the following:
  - 1. Benches and Seats

#### 1.3 ACTION SUBMITTALS

- A. Product Data: Submit for each type of product indicated.
- B. Samples for Initial Selection: For units with factory-applied color finishes.
- C. Samples for Verification: For each type of exposed finish required, prepared on Samples of size indicated below.
  - 1. Size: Not less than 6-inch- (152-mm-) long linear components and 4-inch- (102-mm-) square sheet components.
- D. Product Schedule: For site furnishings. Use same designations indicated on Drawings.
- E. Material Certificates: For site furnishings, signed by manufacturers.
- F. Wood Preservative Treatment: Include certification by treating plant stating type of preservative solution and pressure process used, net amount of preservative retained, and compliance with applicable standards.
- G. Sustainably Harvested Wood: Include certification by manufacturer and from sources that participate in sustained yield programs.
- H. Maintenance Data: For site furnishings to include in maintenance manuals.

#### 1.4 QUALITY ASSURANCE

- A. Source Limitations: Obtain each type of site furnishing(s) through one source from a single manufacturer.

#### 1.5 EXTRA MATERIALS (ATTIC STOCK)

- A. Furnish extra materials described below that match products installed and that are packaged with protective covering for storage and identified with labels describing contents.
  - 1. Bench and Seating Replacement Slats: No fewer than two full-size units for each size indicated.
  - 2. Touch-up Paint: 1 quart supplied by the site furnishings manufacturer for each paint color utilized.

## **PART 2 - PRODUCTS**

### **2.1 MATERIALS**

- A. Aluminum: Alloy and temper recommended by aluminum producer and finisher for type of use and finish indicated; free of surface blemishes and complying with the following:
  - 1. Rolled or Cold-Finished Bars, Rods, and Wire: ASTM B 211.
  - 2. Extruded Bars, Rods, Wire, Profiles, and Tubes: ASTM B 221.
  - 3. Structural Pipe and Tube: ASTM B 429/B 429M.
  - 4. Sheet and Plate: ASTM B 209.
  - 5. Castings: ASTM B 26/B 26M.
- B. Steel and iron: Free of surface blemishes and complying with the following:
  - 1. Plates, Shapes, and Bars: ASTM A 36/A 36M.
  - 2. Steel Pipe: Standard-weight steel pipe complying with ASTM A 53, or electric-resistance-welded pipe complying with ASTM A 135.
  - 3. Tubing: Cold-formed steel tubing complying with ASTM A 500.
  - 4. Mechanical Tubing: Cold-rolled, electric-resistance-welded carbon or alloy steel tubing complying with ASTM A 513, or steel tubing fabricated from steel complying with ASTM A 1011/A 1011M and complying with dimensional tolerances in ASTM A 500; zinc coated internally and externally.
  - 5. Sheet: Commercial steel sheet complying with ASTM A 1011/A 1011M.
  - 6. Malleable-Iron Castings: ASTM A 47/A 47M, grade as recommended by fabricator for type of use intended.
  - 7. Cast Gray Iron: ASTM A823-99(2003).
  - 8. Hot-dip galvanized steel.
- C. Stainless steel: Free of surface blemishes and complying with the following:
  - 1. Sheet, Strip, Plate, and Flat Bars: ASTM A 666.
  - 2. Pipe: Schedule 40 steel pipe complying with ASTM A 312/A 312M.

3. Tubing: ASTM A 554.
- D. Wood: Surfaced smooth on four sides with eased edges; kiln dried, free of knots, solid stock of species indicated.
  1. Comply with materials, standards and instruction as specified in Section 06 2013 "Exterior Finish Carpentry".
- E. Fiberglass: Multiple laminations of glass-fiber-reinforced polyester resin with UV-light stable, colorfast, nonfading, weather- and stain-resistant, colored polyester gel coat, and with manufacturer's standard finish.
- F. Plastic: Color impregnated, color and UV-light stabilized, and mold resistant.
  1. Polyethylene: Fabricated from virgin plastic HDPE resin.
- G. Anchors, Fasteners, Fittings, and Hardware: Stainless steel, Galvanized steel, manufacturer's standard, corrosion-resistant-coated or non-corrodible materials; commercial quality, tamperproof, vandal and theft resistant, concealed, recessed, and capped or plugged.
- H. Non-shrink, Nonmetallic Grout: Premixed, factory-packaged, non-staining, noncorrosive, nongaseous grout complying with ASTM C 1107; recommended in writing by manufacturer, for exterior applications.
- I. Erosion-Resistant Anchoring Cement: Factory-packaged, non-shrink, non-staining, hydraulic-controlled expansion cement formulation for mixing with potable water at Project site to create pourable anchoring, patching, and grouting compound; resistant to erosion from water exposure without needing protection by a sealer or waterproof coating; recommended in writing by manufacturer, for exterior applications.
- J. Galvanizing: Where indicated for steel and iron components, provide the following protective zinc coating applied to components after fabrication:
  1. Zinc-Coated Tubing: External, zinc with organic overcoat, consisting of a minimum of 0.9 oz./sq. ft. (0.27 kg/sq. m) of zinc after welding, a chromate conversion coating, and a clear, polymer film. Internal, same as external or consisting of 81 percent zinc pigmented coating, not less than 0.3 mil (0.0076 mm) thick.
  2. Hot-Dip Galvanizing: According to ASTM A 123/A 123M, ASTM A 153/A 153M, or ASTM A 924/A 924M.

## 2.2 WOOD-PRESERVATIVE-TREATED MATERIALS

- A. Preservative Treatment: Pressure-treat wood according to AWPA U1 and the following:
  1. Use preservative chemicals acceptable to authorities having jurisdiction and containing no arsenic or chromium. Use chemical formulations that do not bleed through or otherwise adversely affect finishes. Do not use colorants to distinguish treated materials from untreated materials.
  2. Kiln-dry lumber and plywood after treatment to a maximum moisture content, respectively, of 19 and 15 percent. Do not use materials that are warped or do not comply with requirements for untreated materials.

## 2.3 FABRICATION

- A. Metal Components: Form to required shapes and sizes with true, consistent curves, lines, and angles. Separate metals from dissimilar materials to prevent electrolytic action.
- B. Welded Connections: Weld connections continuously. Weld solid members with full-length, full-penetration welds and hollow members with full-circumference welds. At exposed connections, finish surfaces smooth and blended so no roughness or unevenness shows after finishing and welded surface matches contours of adjoining surfaces.
- C. Pipes and Tubes: Form simple and compound curves by bending members in jigs to produce uniform curvature for each repetitive configuration required; maintain cylindrical cross section of member throughout entire bend without buckling, twisting, cracking, or otherwise deforming exposed surfaces of handrail and railing components.
- D. Preservative-Treated Wood Components: Complete fabrication of treated items before treatment if possible. If cut after treatment, apply field treatment complying with AWWA M4 to cut surfaces.
- E. Exposed Surfaces: Polished, sanded, or otherwise finished; all surfaces smooth, free of burrs, barbs, splinters, and sharpness; all edges and ends rolled, rounded, or capped.
- F. Factory Assembly: Assemble components in the factory to greatest extent possible to minimize field assembly. Clearly mark units for assembly in the field.

## 2.4 ALUMINUM FINISHES

- A. Baked-Enamel, Powder-Coat Finish: Manufacturer's standard, baked, polyester, powder-coat finish complying with finish manufacturer's written instructions for surface preparation, including pretreatment, application, baking, and minimum dry film thickness.

## 2.5 STEEL AND GALVANIZED-STEEL FINISHES

- A. Baked-Enamel, Powder-Coat Finish: Manufacturer's standard, baked, polyester, powder-coat finish complying with finish manufacturer's written instructions for surface preparation, including pretreatment, application, baking, and minimum dry film thickness.
- B. PVC Finish: Manufacturer's standard, UV-light stabilized, mold-resistant, slip-resistant, matte-textured, dipped or sprayed-on, PVC-plastisol finish, with flame retardant added; complying with coating manufacturer's written instructions for pretreatment, application, and minimum dry film thickness.

## 2.6 IRON FINISHES

- A. Baked-Enamel, Powder-Coat Finish: Manufacturer's standard, baked, polyester, powder-coat finish complying with finish manufacturer's written instructions for surface preparation, including pretreatment, application, baking, and minimum dry film thickness.

## 2.7 STAINLESS-STEEL FINISHES

- A. Surface Preparation: Remove tool and die marks and stretch lines, or blend into finish.
- B. Polished Finishes: Grind and polish surfaces to produce uniform finish, free of cross scratches.

1. Run directional finishes with long dimension of each piece.
2. Directional Satin Finish: No 4.
3. Dull Satin Finish: No. 6.

## 2.8 SITE FURNISHINGS

- A. Refer to contract Drawings.
- B. Subject to compliance with the requirements, provide products manufactured by the manufacturer listed below, or approved equal.
  1. Landscape Forms, Inc.

## **PART 3 - EXECUTION**

### 3.1 EXAMINATION

- A. Examine areas and conditions, with Installer present, for compliance with requirements for correct and level finished grade, mounting surfaces, installation tolerances, and other conditions affecting performance.
  1. Proceed with installation only after unsatisfactory conditions have been corrected.

### 3.2 INSTALLATION, GENERAL

- A. Coordinate installation of all site furnishings with final approved shop drawings.
- B. Comply with manufacturer's written installation instructions unless more stringent requirements are indicated. Complete field assembly of site furnishings where required.
  1. Unless otherwise indicated, install site furnishings after landscaping and paving have been completed.
  2. Install site furnishings level, plumb, true, and securely anchored at locations indicated on Drawings.
  3. Post Setting: Set cast-in support posts in concrete footing with smooth top, shaped to shed water. Protect portion of posts above footing from concrete splatter. Verify that posts are set plumb or at correct angle and are aligned and at correct height and spacing. Hold posts in position during placement and finishing operations until concrete is sufficiently cured.
  4. Posts Set into Voids in Concrete: Form or core-drill holes for installing posts in concrete to depth recommended in writing by manufacturer of site furnishings and 3/4 inch (19 mm) larger than OD of post. Clean holes of loose material, insert posts, and fill annular space between post and concrete with non-shrink grout, mixed and placed to comply with anchoring material manufacturer's written instructions, with top smoothed and shaped to shed water.

5. Pipe Sleeves: Use steel pipe sleeves preset and anchored into concrete for installing posts. After posts have been inserted into sleeves, fill annular space between post and sleeve with non-shrink grout, mixed and placed to comply with anchoring material manufacturer's written instructions, with top smoothed and shaped to shed water.

### **3.3 CLEANING**

- A. After completing site furnishing installation, inspect components. Remove spots, dirt, and debris. Repair damaged finishes to match original finish or replace component.

### **END OF SECTION 323300**

\\langan.com\data\PAR\data2\101053201\Project Data\Specifications\FOR BID\323300 Site Furnishings.docx

## SECTION 329100 - PLANTING

### PART 1 GENERAL

#### 1.01 SECTION INCLUDES

- A. Preparation and excavation of planting beds.
- B. Planting of trees, shrubs, sod, seed, and associated materials.
- C. Provide and execute Maintenance Contract.

#### 1.02 RELATED SECTIONS

- A. Section 312000 - Earthwork
- B. Section 312200 - Erosion Control and Sedimentation
- C. Section 329113 - Planting Soil Mixing
- D. Construction Drawings

#### 1.03 REFERENCE STANDARDS

- A. American National Standard Institute (ANSI)
  - 1. Z60.1 American Standard for Nursery Stock
- B. American Sod Producer Association (ASPA)
- C. American Nursery and Landscape Association (ANLA)

#### 1.04 QUALITY ASSURANCE

- A. No error or discrepancy in Construction Drawings or Specifications shall cause defective or inappropriate materials to be used or poor workmanship to be allowed. All work completed and materials furnished and installed shall be of the best quality and shall be in strict accordance with the intention of the Drawings, Specifications and samples.
- B. Work must be carried out only during weather conditions favorable to landscape construction and to the health and welfare of plants.
- C. Before commencing work, all trees and shrubs which are to be saved must be protected from damage by the placement of fencing flagged for visibility or some other suitable protective procedure approved by Construction Manager and Engineer. No Work may begin until this requirement is fulfilled.

- D. In order to avoid damage to roots, bark or lower branches, no truck or other equipment shall be driven or parked within the drip line of any tree, unless the tree overspreads a paved way.
- E. The Contractor shall use any and all precautionary measures when performing Work walks, pavements, utilities, and any other features either existing or previously installed under this Contract.
- F. The Contractor shall adjust depth of earthwork and planting soiling when working immediately adjacent to any of the aforementioned features in order to prevent disturbing tree roots, undermining walks and pavements, and damage in general to any existing or newly incorporated item.
- G. Plants transported to the Project in open vehicles shall be covered with tarpaulins or other suitable covers securely fastened to the body of the vehicle to prevent injury to the plants. Closed vehicles shall be adequately ventilated to prevent overheating of the plants. Evidence of inadequate protection following digging, carelessness while in transit, or improper handling or storage shall be cause for rejection. All plants shall be kept moist, fresh, and protected. Such protection shall encompass the entire period during which the plants are in transit, being handled, or are in temporary storage.
- H. Measure plants when branches are in their normal position.
- I. Trees and shrubs shall meet requirements for spread, height, or container size stated in Construction Drawings.
  - 1. Measurements are to be taken from ground level to average height of shrub and not to longest branch.
  - 2. Height and spread dimensions specified herein refer to main body of trees measured from crown of roots to tip of top branch.
- J. Caliper measurements shall be taken at point on tree trunk 6-inches above natural ground line for trees up to 4-inches in caliper, and at point 12-inches above natural ground line for trees exceeding 4-inches in caliper.
- K. If range of sizes is given, no plant shall be less than minimum size, and at least 50 percent of plants shall be as large as upper half of range specified.
- L. Measurements specified are minimum size acceptable and, where pruning is required, are measurements after pruning.
- M. Condition of new plant materials is the responsibility of the Contractor and shall be approved by the Owner. Landscape Architect and/or Owner reserves the right to inspect and reject plants at any time and at any place, and reserves the right to inspect plants at the growing nursery.
- N. Landscape Architect and/or Owner shall have the final approval for acceptance of the landscape planting work.

## **1.05 SUBMITTALS**

- A. Before ordering or purchasing materials, provide samples of those materials to Owner for approval, if so requested.
- B. Submit certification tags from trees, shrubs, sod, and seed verifying type and purity.
- C. Unless otherwise authorized by Owner, notify Owner at least 48 hours in advance of anticipated delivery date of plant materials. Legible copy of invoice, showing kinds and sizes of materials included for each shipment, shall be furnished to Owner.
- D. Inform Owner of date when planting shall commence.

#### **1.06 PROJECT CONDITIONS**

- A. Work must be carried out only during weather conditions favorable to landscape construction and to health and welfare of plants. Owner shall determine suitability of such weather conditions.

#### **1.07 MAINTENANCE OPERATIONS BEFORE APPROVAL**

- A. Plant care shall begin immediately after each plant is satisfactorily installed and shall continue throughout the life of the Contract until final acceptance of the Project by the Authority.
- B. Care shall include, but not be limited to, replacing mulch that has been displaced by erosion or other means, repairing and reshaping water rings or saucers, watering when needed or directed, and performing any other Work required to keep the plants in a healthy condition.
- C. Contractor shall remove and replace all dead, defective and/or rejected plants as required before final acceptance by Authority.

#### **1.08 NOTIFICATION OF DELIVERY**

- A. Unless otherwise authorized by Engineer, the Contractor shall notify Construction Manager at least 48 hours in advance of the anticipated delivery date of any plant materials for immediate forwarding to the Engineer. A legible copy of the invoice, showing kinds and sizes of materials included for each shipment shall be furnished to the Construction Manager for the review of the Engineer.

#### **1.09 GUARANTEE**

- A. Care shall include, but not be limited to, replacing mulch that has been displaced by erosion. Contractor shall guarantee all plant material for a period of two years from the date of acceptance by the Authority. All plant material either dead or in decline shall be replaced at no additional cost to the Authority.
- B. The condition of all new plant materials is the responsibility of the Contractor and shall be approved by Engineer.
- C. Until final approval from the Engineer and acceptance by the Authority, any replacement of plant materials that may be necessary shall be at the expense of the Contractor.

- D. In addition to other standard provisions, the Contractor's bid amount shall also provide for the following:
- a. Maintenance necessary during Establishment Period, through final acceptance by the Authority.
  - b. Replacement in kind, or with a plant of similar species and size acceptable to Engineer, of all plant materials not in a healthy growing condition or that has died back to the crown or beyond normal pruning limits.
  - c. The Contractor shall also be responsible for any damage caused by his operations and shall dispose of all rubbish and excess soil as directed by the Construction Manager.

## **PART 2      PRODUCTS**

### **2.01    PLANT MATERIALS**

- A. Plant material (trees and shrubs) shall conform to requirements of ANSI Z60.1 of rules and grading upgraded to meet the following:
1. Plants shall be of selected specimen quality, exceptionally heavy, symmetrical, tightly knit, so trained or favored in their development and appearance as to be superior in form, number of branches, compactness and symmetry. Plants shall have normal habit or sound, healthy, vigorous plants with well developed root system.
  2. Plants shall be free of disease, insect pests, eggs, or larvae.
  3. Plants shall not be pruned before delivery.
  4. Trees with abrasion of bark, sunscalds, disfiguring knots, or fresh cuts of limbs over 1 1/4-inch, which have not completely calloused, shall be rejected.
  5. Plants shall be typical of their species or variety and shall have normal habit of growth and be legibly tagged with proper name. Plants shall have been grown under climatic conditions similar to those of site or have been acclimated to such condition for at least 2 years.
  6. Root system of each plant shall be well provided with fibrous roots. Parts shall be sound, healthy, vigorous, well-branched, and densely foliated when in leaf.
  7. Plants designated ball and burlap must be moved with root systems as solid units with balls of earth firmly wrapped with burlap and comply with the following:
    - a. Diameter and depth of balls of earth must be sufficient to encompass fibrous root feeding systems necessary for healthy development of plant.
    - b. No plant shall be accepted when ball of earth surrounding its roots has been badly cracked or broken preparatory to or during process of planting. Balls shall remain intact during all operations.
    - c. Plants that cannot be planted at once must be heeled-in by setting in ground and covering balls with soil or mulch and then watering.
    - d. Hemp burlap and twine is preferable to treated. If treated burlap is used, twine is to be cut from around trunk and burlap is to be removed.
  8. Trunk of each tree shall be single trunk growing from single unmutated crown of roots. No part of trunk shall be conspicuously crooked as compared with normal trees of same variety.
  9. Thickness of each shrub shall correspond to trade classification "No.1". Single stemmed or thin plants shall not be accepted. Side branches must be generous, well-twigged, and plant as whole well-branched to ground. Plants must be in moist condition, free from dead wood, bruises, or other root or branch injuries.

2.02 SOD

- A. Sod shall be species ASPA certified. Sod to be strongly rooted, weed, disease, pest free and uniform in thickness.

2.03 TOPSOIL

- A. Refer to Specification 329113 - Planting Soil Mixing.
- B. Refer to Planting Soil Specifications on the Drawings.

2.04 FERTILIZER

- A. Deliver fertilizer, mixed as specified, in original unopened standard size bags showing weight, analysis and name of manufacturer. Containers shall bear manufacturer's guaranteed statement of analysis, or manufacturer's certificate of compliance covering analysis shall be furnished to Owner. Store fertilizer in such manner that it shall be kept dry.
- B. Base percentages of nitrogen, phosphorus, and potash on laboratory test recommendations as approved by Owner. For bidding assume 10 percent nitrogen, 6 percent phosphorus, and 4 percent potash by weight. At least 50 percent of total nitrogen shall contain no less than 3 percent water-insoluble nitrogen. At least 60 percent of nitrogen content shall be derived from super-phosphate containing not less than 18 percent phosphoric acid or bone meal containing 25 - 30 percent phosphoric acid and 2 - 3 percent nitrogen. Potash shall be derived from muriate of potash containing 55 - 60 percent potash.

2.05 PEAT MOSS

- A. Peat moss shall be Michigan peat moss or approved equal in color and consistency.
- B. Peat moss shall be moss peat, finely shredded to pass 1/2-inch mesh and shall be no less than 90 percent organic material by weight, with ash content by ignition of no more than 10 percent.
- C. Material shall contain 35 - 66 percent moisture by weight, but shall have water-holding capacity of 150 - 200 percent.
- C. Material shall have pH value of 4 to 5.
- D. Material may be imported supplied in bales or domestic furnished in bulk. If furnished in bulk, material and its source must be acceptable to Owner.
- E. Peat moss may NOT be used as an organic matter amendment to Planting Soil.

2.06 SHREDDED HARDWOOD BARK MULCH

- A. Mulch shall be of sufficient character as not to be easily displaced by wind or water runoff.

**2.07 STAKING MATERIAL**

- A. Stakes shall be 8-ft steel tee posts. Three stakes shall be used for each tree.
- B. Wire used for tree staking shall be pliable No. 12 galvanized soft steel wire.
- C. Hose shall be 2-ply fibred-bearing rubber garden hose, not less than 1/2-inches inside diameter, black or green, and of suitable length.

**2.08 WATER**

- A. Potable water, on-site water shall be furnished by Owner. Contractor shall furnish hose and other watering equipment.

**2.09 WEED MAT**

- A. Weed mat shall be "Dewitt Weed Barrier" or approved equal.

**2.10 STEEL EDGING**

- A. Steel edging shall be 1/8-inch x 4-inch interlocking steel edge, staked with metal stakes sufficiently to hold in place.

**2.11 STONE MULCH**

- A. Size and color of stone mulch should be as shown on Construction Drawings.

**2.13 EROSION CONTROL BLANKET**

- A. Blankets, biodegradable, enclosed in a photodegradable plastic mesh, including steel wire staples, 6 inches long.
- B. Provide and install where indicated on Construction Drawings "Curlex" blankets by American Excelsior Company, "Polyjute" Style 465 GT by Synthetic Industries, or approved equal.

**2.14 ANTI-DESICCANT SPRAY**

- A. Spray shall be an emulsion which will provide a protection fill over plant surfaces. It shall be permeable enough to permit transpiration. It shall be delivered in the manufacturer's containers and mixed according to the manufacturer's instructions.

**PART 3 EXECUTION**

**3.01 PLANTING COORDINATION**

- A. The Contractor shall inform Engineer through the Construction Manager of the date when the planting shall commence and of the anticipated delivery date of the material.

- B. Failure to notify Engineer through Construction Manager in advance of order to arrange proper scheduling may result in loss of time or rejection of a plant or plants not installed as specified or directed.

### 3.02 PREPARATION

- A. If project completion date prohibits in-season planting, prepare for out-of-season seeding or sodding so that lawns shall be completed and ready for acceptance at time of project completion, without additional cost to Owner.
- B. Provide sufficient tools and equipment required to carry out planting operation.
- C. Locations containing unsuitable subsoil shall be treated by one or more of the following:
  - 1. Where unsuitability is deemed by Owner to be due to excessive compaction caused by heavy equipment and where natural subsoil is other than AASHTO classification of A6 or 7, loosen such areas with spikes, disking, or other means to loosen soil to condition acceptable to Owner. Loosen soil to minimum depth of 12-inches with additional loosening as required to obtain adequate drainage. Contractor may introduce peat moss, sand, or organic matter into the subsoil to obtain adequate drainage. Such remedial measures shall be considered as incidental, without additional cost to Owner.
  - 2. Where unsuitability is deemed by Owner to be due to presence of boards, mortar, concrete, or other construction materials in sub-grade and where natural subsoil is other than AASHTO classification of A6 or 7, remove debris and objectionable material. Such remedial measures shall be considered as incidental, without additional cost to Owner.
  - 3. Where unsuitability is deemed by Owner to be because natural subsoil falls into AASHTO classification of A6 or 7 and contains moisture in excess of 30 percent, then installation of sub-drainage system or other means described elsewhere in Specifications shall be used. Where such conditions have not been known or revealed prior to planting time and they have not been recognized in preparation of Construction Drawings and Specifications, then Owner shall issue pricing order to install proper remedial measures.
- D. Perform planting operations at steady rate of work unless weather conditions make it impossible to work. No plant material shall be planted in frozen ground.
- E. Disk, drag, harrow, or hand rake subgrade to depth of 6-inches and removed stones larger than 1-1/2 inches to provide bond for topsoil. Topsoil, which must be transported across finished sidewalks, shall be delivered in such manner that no damage will be done to sidewalks. Contractor shall be responsible for repair of such damage.
- F. Do not place topsoil until subgrade has been approved in accordance with Section 312000. Before placing topsoil, rake subsoil surface clear of stones, debris, and roots. Compact topsoil to form layer with minimum depth of 6-inches in lawn areas and 12-inches in shrub beds. Place topsoil so that after final settlement there will be positive drainage conforming to elevations shown on Construction Drawings.
- G. Tree and Shrub Preparation

1. Dig bare rooted shrubs with adequate fibrous roots. Cover roots of these plants with uniformly thick coating of mud by being puddled immediately after they are dug, or packed in moist straw or moss.
  2. Dig ball and burlap plants with firm natural balls of earth of diameter and depth to include fibrous roots.
  3. Protect roots or balls of plants at all times from sun and drying winds.
  4. Ball and burlap plants which cannot be planted immediately upon delivery shall be set on ground and protected with soil, wet moss, or other acceptable material. Heel-in bare rooted plants that cannot be planted immediately upon delivery. All shall be kept moist.
  5. Open bundles of plants and separate before roots are covered. Take care to prevent air pockets among roots. During planting operations, cover bare roots with canvas, hay, or other suitable material. No plant shall be bound with wire or rope at any time so as to damage bark or break branches.
- H. Sod Bed Preparation: Grade areas to finish grade, filling as needed or removing surplus dirt, stones, debris, etc. and floating areas to smooth, uniform grade as indicated on Construction Drawings. Lawn areas are to slope to drain.
- I. Grass or sodded areas shall have fertilizer applied in two (2) applications with a thorough watering as specified in section 4.02 B immediately following each application. The first application shall be one (1) week prior to seeding/sodding at the rate of 25 pounds per 1000 square feet and barrowed into the top two (2) inches of topsoil. The second application shall be at the rate of 10 pounds per 1000 square feet immediately following the second mowing.
- J. Adjustments in locations of planting beds and bed lines shall be made as directed by the Engineer. In the event that pits or areas for planting are prepared and backfilled with planting soil to grade prior to commencement of lawn operations, they shall be so marked that when the Work of planting proceeds, they can be readily located. In case underground obstructions such as ledges or utilities are encountered, location shall be changed under the direction of Engineer without charge to the Authority.
- K. Holes for trees shall conform to the planting details and all plans shall sit at the same elevation as grown in the nursery.
- L. Ground limestone shall be added to the planting soil for backfilling tree holes and shrub beds as the progress of the Work permits if soil tests indicate it is needed, and commercial fertilizer at the rate of three (3) pounds for tree up to three inches (3") in caliper, one (1) pound per one inch (1") in caliper for larger trees, six (6) ounces for small shrubs and eight (8) ounces for each shrub four feet (4') or over. Ground limestone shall be omitted in the case of acid soil plants. The limestone and fertilizer shall be thoroughly mixed with the planting soil in the planting operation.
- M. The plants shall be planted in the center of the holes and at the same elevation as they grew in the nursery. Planting soil shall be backfilled in layers of not more than eight inches (8") and each layer watered sufficiently to settle before the next layer is put in place. Planting soil shall be tamped under edges of balled plants. Enough planting soil shall be used to bring the surfaces to finish grade when settled.
- a. A saucer shall be provided around each plant as shown on the Drawings.

- b. Plants shall be soaked with water twice within the first twenty-four (24) hours of time of planting. Water shall be applied with low pressure so as to soak in thoroughly without dislodging the planting soil.
- c. A three inch (3") layer (after settlement) of mulch or approved equal shall be applied to the outside edge of each tree pit saucer or planting bed.

### 3.03 PROTECTION

- A. Before commencing work, trees and shrubs that are to be saved shall be protected from damage by placement of fencing flagged for visibility or some other suitable protective procedure approved by Owner. No work may begin until this requirement is fulfilled.
- B. In order to avoid damage to roots, bark, or lower branches, no truck or other equipment shall be driven or parked within drip line of any tree, unless tree overspreads paved area.
- C. Use precautionary measures when performing work around trees, sidewalks, pavements, utilities, and other features either existing or previously installed.
- D. Adjust depth of earthwork and topsoil when working immediately adjacent to aforementioned features in order to prevent disturbing tree roots, undermining sidewalks and pavements, and damage in general to other features either existing or previously installed.
- E. Cover plants transported to project in open vehicles with tarpaulins or other suitable covers securely fastened to body of vehicle to prevent injury to plants. Closed vehicles shall be adequately ventilated to prevent overheating of plants. Evidence of inadequate protection following digging, carelessness while in transit, or improper handling or storage shall be cause for rejection. Plants shall be kept moist, fresh, and protected. Such protection shall encompass entire period during which plants are in transit, being handled, or are in temporary storage.
- F. Where excavating, fill, or grading is required within drip line of trees that are to remain, work shall be performed as follows:
  - 1. Trenching: When trenching occurs around trees to remain, tree roots shall not be cut but trench shall be tunneled under or around roots by careful hand digging without injury to roots.
  - 2. Raising Grades:
    - a. Where fill not exceeding 16-inches is required, clean, washed gravel graded from 1-inch to 2-inch in size shall be placed directly around tree trunk. Extend gravel out from trunk on all sides minimum of 18-inches and finish approximately 2-inches above finished grade at tree. Install gravel before any earth fill is placed. New earth fill shall not be left in contact with trunks of trees requiring fill.
    - b. Where fill exceeding 16-inches is required, construct dry laid tree well around trunk of tree. Tree well shall extend out from trunk on all sides minimum of 3-feet and to 3-inches above finish grade. Place coarse grade rock directly around tree well extending out to drip line of tree. Place clean, washed gravel graded from 1-inch. to 2-inch. in size directly

over coarse rock to depth of 3-inches. Place approved backfill material directly over washed gravel to desired finish grade.

3. Lowering Grades: Existing trees in areas where new finish grade is to be lowered shall have regrading work done by hand to elevation indicated on Construction Drawings. Roots as required shall be cut cleanly 3-inches below finished grade and scars covered with tree paint.
4. Trees marked for preservation that are more than 6-inches above proposed grades shall stand on broad rounded mounds and be graded smoothly into lower level. Trees located more than 16-inches above proposed grades shall have dry laid stone wall or other retaining structure as detailed on Construction Drawings constructed minimum of 5-feet from trunk. Exposed or broken roots shall be cut clean and covered with topsoil.

### 3.04 TREE AND SHRUB PLANTING

- A. Plants too large for 2 men to lift in and out of holes shall be placed with sling. Do not rock trees in holes to raise.
- B. If rock or other underground obstruction is encountered, Owner may require plant pits to be relocated, pits enlarged, or plants deleted from project.
- C. Make adjustments in locations as directed. In event that pits or areas for planting are prepared and backfilled with topsoil to grade prior to commencement of lawn operations, they shall be so marked that when planting proceeds, they can be readily located. In case underground obstructions such as ledges or utilities are encountered, change location under direction of Owner without charge.
- D. Holes for trees shall be at least 2-feet greater in diameter than spread of root system and at least 6-in. deeper than root ball. Holes for shrubs and vines shall be at least 12-inches greater in diameter than spread of root system and at least 2-feet deep.
- E. During backfilling of tree holes and shrub beds with topsoil, manure, ground limestone (if soil tests indicate it is needed), and commercial fertilizer at rate of 3-pounds for trees up to 3-inches in caliper, 1-pound per inch caliper for larger trees, 6-ounces for small shrubs and 8-ounces for each shrub 4-feet or over shall be added as progress of work permits. Omit ground limestone and manure in case of acid soil plants. Manure, limestone, and fertilizer shall be thoroughly mixed with topsoil in planting operation; care being taken that manure does not come in immediate contact with roots.
- F. Plants shall be planted in center of holes and at same depth as they previously grew. Backfill topsoil in layers of not more than 8-inches and each layer watered sufficiently to settle before next layer is put in place. Tamp loam under edges of balled plants. Use enough topsoil to bring surfaces to finish grade when settled.
  1. Provide saucer around each plant as shown on Construction Drawings.
  2. Soak plants with water twice within first 24 hours after time of planting. Apply water with low pressure so as to soak in thoroughly without dislodging topsoil.
  - 3.

### 3.05 MISCELLANEOUS INSTALLATIONS

- A. Shredded Hardwood Bark Mulch
  - 1. Use 3-inches of shredded hardwood bark mulch or approved equal as top dressing in planting beds. Mulch single trees or shrubs to outside edge of saucer.
- B. Use peat moss for planting soil mixture only and not be used as mulch, except on ground cover.
- C. Apply fertilizer to grass or sodded areas in 2 applications with thorough watering immediately following. First application shall be 1 week before seeding at rate of 35-pounds per 1,000 square feet harrowed into top 2-inches of seedbed. Second application shall be done at rate of 25-pounds per 1,000 square feet, immediately following second mowing.
- D. Peg sodded slopes greater than 3:1 to hold in place.
- E. Areas to be covered with erosion control blankets shall be properly prepared, fertilized, and seeded before blanket is applied. When blanket is unrolled, netting shall be on top and fibers in contact with soil. In ditches, apply blanket in direction of flow of water. On slopes, apply blankets vertically on slope. Butt ends and sides snugly and stapled. Staple to manufacturer's recommendations.

### 3.06 SOD

- A. Cut and lay sod on same day. Only healthy vigorous growing sod is to be laid.
- B. Always lay sod across slope and tightly together so as to make solid area.
- C. Roll or firmly but lightly tamp with suitable wooden or metal tamper new sod sufficiently to set or press sod into under laying soil.
- D. After sodding has been completed, clean up and thoroughly moisten newly sodded areas.

### 3.07 MAINTENANCE DURING CONSTRUCTION

- A. Begin maintenance immediately after planting. Plants shall be watered, mulched, weeded, pruned, sprayed, fertilized, cultivated, and otherwise maintained and protected until acceptance. Settled plants shall be reset to proper grade and position, planting saucer restored, and dead material removed. Tighten and repair stakes and wires. Correct defective work as soon as possible after it becomes apparent and weather and season permit.
- B. If a substantial number of plants are in decline or dead at the time of inspection, acceptance shall not be granted and the Contractor's responsibility for maintenance of all plants shall be extended until replacements are made or existing plants are deemed acceptable by Landscape Architect.
- C. All replacements shall be plants of the same kind and size specified in the Plant schedule as shown on landscape plant schedule. They shall be furnished and planted as specified above. The cost shall be borne by the Contractor. After Substantial Completion

replacements resulting from removal, loss, or damage due to vandalism, physical damage by animals or vehicles shall be approved and paid for by the Authority.

- D. Plants shall be guaranteed for a period of two (2) years after inspection and acceptance.
- E. At the end of the Establishment Period, inspection shall be made again. Any plant required under this Contract that is dead or unsatisfactory to Engineer or Authority shall be removed from the Site. These shall be replaced by Contractor during the normal planting season at no additional cost to the Authority.
- F. Maintain lawns for at least 30 days after sodding, or as long as is necessary to establish uniform stand of the specified grasses, or until substantial completion of project, or until acceptance of lawns, whichever is later.
- G. In event that lawn operations are completed too late in Fall for adequate growth, maintenance shall continue into following growing season or until uniform stand of specified grasses has been established.
- H. Make weekly inspections to determine moisture content of soil and adjust watering schedule established by irrigation system installer to fit conditions.
- I. After grass growth has started, areas that fail to show uniform stand of grass for any reason whatsoever shall be reseeded in accordance with Construction Drawings and as specified herein. Such areas shall be reseeded repeatedly until areas are covered with satisfactory growth of grass at no additional cost to Owner.
- J. Watering shall be done in such manner and as frequently as is deemed necessary by Owner to assure continued growth of healthy grass. Water areas of site in such way as to prevent erosion due to excessive quantities applied over small areas and to avoid damage to finished surface due to watering equipment.
- K. Water for execution and maintenance will be provided by Owner at no expense to Contractor. Contractor shall furnish portable tanks, pumps, hose, pipe, connections, nozzles, and any other equipment required to transport water from available outlets and apply it to seeded areas in approved manner.
- L. Initiate mowing of seeded areas when grass has attained height of 1 1/2-inches to 2-inches. Maintain grass height at 1-inch to 1 1/2-inches at subsequent cuttings depending on time of year. Not more than 1/3 of grass leaf shall be removed at any cutting and cutting shall not occur closer than 10 days apart.
- M. Heavy cuttings shall be removed to prevent destruction of underlying turf. If weeds or other undesirable vegetation threaten to smother planted species, such vegetation shall be mowed or, in case of rank growths, shall be uprooted, raked and removed from area by methods approved by Owner.
- N. Protect sodded area from trespassing while grass is rooting. Furnish and install fences, signs, barriers, or other necessary temporary protective devices. Contractor shall repair damage resulting from trespass, erosion, washout, settlement, or other causes at his expense.

- O. Remove fences, signs, barriers, or other temporary protective devices after final acceptance.
- P. If substantial number of plants are sickly or dead at time of inspection, acceptance will not be granted and Contractor's responsibility for maintenance of plants shall be extended until replacements are made.
- Q. Replacements shall be plants of same kind and size specified on Construction Drawings. Furnish and plant as specified herein. Cost shall be borne by Contractor. Replacements resulting from removal, loss, or damage due to occupancy of project in any part, vandalism, physical damage by animals, vehicles, etc., and losses due to curtailment of water by local authorities will be approved and paid for by Owner.
- R. Remove and replace dead, defective and/or rejected plants as required before final acceptance. Replacement of plant materials that may be necessary shall be at expense of Contractor.
- S. Grassed areas damaged during process of work shall be responsibility of Contractor, who shall restore disturbed areas to condition satisfactory to Owner. This may include filling to grade, fertilizing, seeding, and mulching.
- T. Guarantee plants for period of 2 years after inspection and acceptance.
- U. At end of Establishment Period, inspection shall be made again. Remove from site any plant that is dead or unsatisfactory to Owner. Replace plants during normal planting season.

### 3.08 MAINTENANCE

#### A. GENERAL LANDSCAPING

- 1. Provide Owner with 3 written proposals due before possession date for landscape maintenance from experienced local nursery businesses capable of performing work specified herein. Accepted proposal and maintenance contract will be for period of 2 years and renewable in 1-year increments. Maintenance will begin immediately after final acceptance of landscaping by Owner. During the first year warranty period, the Contractor shall be responsible for insuring that the maintenance contract is being followed.
- 2. Landscape maintenance shall include necessary watering, cultivation, weeding, pruning, wound dressing, disease and insect pest control, protective spraying, labor for replacement of dead plant material, straightening plants which lean or sag, adjustments of plants which settle or are planted too low, mowing, replacement of mulch that has been displaced, repairing and reshaping of saucers, and reseeding or replanting of those areas affected. Remove rubbish, waste, tools, and equipment used at end of each workday. Other procedures consistent with good horticultural practice necessary to insure vigorous, healthy growth of plant material are also part of Maintenance Contract.
- 3. During first year of Maintenance Contract, replacement of plant material shall be responsibility of Contractor with exceptions as listed herein.

4. Landscape maintenance contractor shall purchase and maintain Contractor's general liability insurance in amount of \$1,000,000 for protection from Contractor's operations under Maintenance Contract. Certification of such insurance shall be filed with Owner prior to commencement of work.
- B. Watering
1. The irrigation system, if installed on the Site, shall be used by the landscape maintenance Contractor for the watering program, but any failure of the system does not eliminate the landscape maintenance Contractor's responsibility for maintaining the desired level of moisture necessary to maintain vigorous, healthy growth.
  2. It shall be the contractor's responsibility of maintaining desired level of moisture necessary to maintain vigorous, healthy growth.
  3. Water shall be applied each time sufficient to penetrate soil to minimum depth of 8-inches in shrub beds and 6-inches in turf areas at rate that will prevent saturation of soil.
  4. On-site water shall be furnished by Owner. Contractor shall furnish hose and other watering equipment.
- C. Weeding: Landscape maintenance contractor shall keep areas free from weeds and undesirable grasses by a method and by materials approved by the American Association of Nurserymen (A.A.N.).
- D. Disease and insect pest control: Inspect plant material at least once each month to locate any disease or insect pest infestations. Upon discovery of infestation, nature or species of infestation shall be identified. Control in accordance with industry standards shall be immediately implemented.
- E. Fertilizing: Landscape maintenance contractor is to fertilize on regularly scheduled program to fit requirements of plant material to maintain vigorous, healthy growth.
- F. Pruning and repair: Amount of pruning shall be limited to minimum necessary to remove dead or injured branches, to compensate for loss of roots as result of transplanting operations, and to maintain safety in traveled areas. Pruning shall be done to not change the natural habit or shape of plant. Cuts shall be made flush, leaving no stubs.
- G. Mowing: Mow grass areas at regular intervals to keep grass height from exceeding 3-inches. Mow in such manner as to prevent clippings from blowing onto paved areas and sidewalks. Cleanup after mowing shall include sweeping or blowing to clear mowing debris.
- H. Clean up: During course of maintenance, excess and waste materials shall be continuously and promptly removed at end of each workday.

- I. Maintenance report and schedule of activities: Landscape maintenance contractor shall provide schedule and report to Owner that details planned maintenance activities including names of any subcontractors.
- J. Maintenance Contract: These terms and conditions herein outlined shall be attached and made a part of a maintenance contract with the Owner.

**3.09 TERMINATION OF THE MAINTENANCE CONTRACT**

- A. If the landscape Maintenance Contractor defaults or persistently fails or neglects to carry out the required Site landscape maintenance work, the Authority, after twelve (12) days' written notice to the landscape maintenance Contractor, and without prejudice to any other remedy they may have, may make good such deficiencies and receive a credit from the landscape maintenance Contractor for such costs.

**END OF SECTION 329100**

\\langan.com\data\PAR\data2\101053201\Project Data\Specifications\FOR BID\329100 Planting.docx

## SECTION 329113 - PLANTING SOIL MIXING

### PART 1 - GENERAL

#### 1.01 SCOPE OF WORK

- A. Furnishing materials from approved off-site source(s) as a base component for planting soil mixes and furnishing other soil amendment materials.
- B. Blending and preparing planting soils for plant areas.
- C. Delivering, placing, and fine grading pre-mixed light weight structural soils and planting soil material of the type(s) indicated for plant areas.
- D. Protecting all plant mix installations with snow fencing, filter fabric, or other approved means, over the surface area plant bed installations, until substantial completion.
- E. Protection of finished paving, light poles utility or other finished work by means of wooden protection boards, or other approved means, over the area of construction concurrent with any and all construction operations.

#### 1.02 RELATED SECTIONS

- A. Section 329100 – Planting
- B. Construction Drawings

#### 1.03 SUBMITTALS

- A. Product Data: Submit technical descriptive data for each manufactured or packaged product of this Section. Include manufacturer's product testing and analysis and installation instructions for manufactured or processed items and materials.
- B. Locations: Submit locations of material sources. Submit location of mixing sites.
- C. Certificates:
  - 1. Submit certified analysis for each soil treatment, amendment, and fertilizer material specified and as used. Include guaranteed analysis and weight for packaged materials.
- D. Test Reports; Submit written reports of each sample tested. Each report shall include the following as a minimum and such other information required specific to material tested:
  - 1. Date issued.
  - 2. Project Title and names of Contractor and supplier.
  - 3. Testing laboratory name, address and telephone number, and name(s), as applicable, of each field and laboratory inspector.
  - 4. Date, place, and time of sampling or test, with record of temperature and weather conditions.
  - 5. Location of material source.

6. Type of test.
  7. Results of tests including identification of deviations from acceptable ranges. Identify any toxic substance(s) harmful to plant growth or life.
- E. Samples:
1. Compost, each source, 5 lb. packaged.
  2. Base material, each source, 5 lb. packaged.
  3. Each mix type specified, 5 lb. packaged.
  4. Filter fabric or woven geomembrane, 12" x 12".
- F. Statement(s) of Qualifications: Submit within 45 days of notice to proceed to confirm qualifications as specified in Article 1.04, herein.
- G. Schedule and Protection Plan: Submit a detailed plan for scheduling and sequencing of all contract work and for protection of soil mixes and other completed work including coordination with contractors requiring access through the site. Indicate with schedules and plans the utilization of soil mix and subsoil protection measures (filter fabric and snow fencing) over the surface area of plant bed installations, until substantial completion. Indicate with schedules and plans the utilization of finished work protection measures (wooden protection boards or other approved methods) over the work area of construction operations concurrent with all construction operations until substantial completion.

#### 1.04 QUALITY ASSURANCE

1. Qualifications:
  - a. Installation and maintenance foreman on the job shall be competent English-speaking supervisor(s), experienced in landscape installation and maintenance.
  - b. Perform work with personnel totally familiar with planting soil preparation and planting installations under the supervision of a foreman experienced with landscape work.
  - c. Soil Scientist or Agricultural Chemist: Experienced person or persons employed by public or private soils testing laboratory, qualified and capable of performing tests, making soil recommendations, and issuing reports as specified. Testing Laboratory and Agricultural Chemist shall be as approved by the Landscape Architect.
2. References:
  - a. Association of Official Agricultural Chemists.
  - b. American Society for Testing and Materials (ASTM) using test criteria as specified or required by other references.
  - c. American Society of Agronomy and Soil Science Society of America, Methods of Soil Analyses, Volumes I and II

- d. U.S. Composting Council Test Method for the Examination of Composting and Compost (TMECC)
  - e. Pre-installation Conferences: Person(s) responsible for soil preparation and mixes of this Section shall attend Pre-installation Conference(s) to coordinate with work of other sections.
3. Inspections and Testing:
- a. Soil, compost, and other material testing and soil mix testing required in this Section or additionally required by Owner's Representative shall be furnished and paid for by Contractor.
  - b. Owner's Representative or Landscape Architect reserve the right to take and analyze at any time such additional samples of materials as deemed necessary for verification of conformance to specification requirements. Contractor shall furnish samples for this purpose upon request and shall perform testing as requested.
  - c. The following testing facilities have been pre-approved for testing of planting soil components and blended planting soil mixes. Testing agencies not listed below shall be approved by the GRG Representative.
  - d. Soil Physical Parameters and Nutrient/Micronutrient Testing:
    - i) Rutgers Soil Testing Laboratory, 20 Indyk-Engel Way, North Brunswick Township, NJ 08902, or approved equal
  - e. Compost Testing:
    - i) Woods End Research Laboratory, 290 Belgrade Road, Mt Vernon ME 04352, Phone: 207-293-2457, Fax: 207-293-2488, [www.woodsend.org](http://www.woodsend.org), or approved equal
  - f. Biological Testing:
    - i) Soil Foodweb Inc, 1645 Washington Avenue Bohemia, NY, 11716, tel: 631.750.1553 [www.soilfoodweb.com](http://www.soilfoodweb.com)
    - ii) Earthfort Laboratory, 635 SW Western Blvd, Corvallis, OR 97333, (541) 257-2612

#### 1.05 REGULATORY REQUIREMENTS

- A. Comply with all rules, regulations, laws and ordinances of focal, state and federal authorities having jurisdiction. Provide labor, materials, equipment and services necessary to make work comply with such requirements without additional cost to Owner.
- B. Procure and pay for permits and licenses required for work of this section. Comply with the requirement of the Remedial Action Work Plan for the project.

#### 1.06 PROJECT/SITE CONDITIONS

- A. Acquaintance With Existing Site Conditions

1. Through study of all Contract Documents and by careful examination of the site, become informed as to the nature and location of the Work, the nature of surface and subsurface soil conditions, the character, quality and quantity of the materials to be encountered, the character of equipment and facilities needed preliminary to and during the prosecution of the Work, the general and local conditions, and all other matters which can in any way affect the Work.
2. Investigate the conditions to public thoroughfares and roads as to availability, clearances, loads, limits, restrictions, and other limitations affecting transportation to, ingress and egress of this work site. Conform to all governmental regulations in regard to the transportation of materials to, from, and at the job site, and secure in advance such permits as may be necessary.
3. Should the Contractor, in the course of Work, find any discrepancies between Contract Drawings and physical conditions or any omissions or errors in Drawings, or in layout as furnished by the Owner, it will be Contractor's duty to inform the Landscape Architect immediately in writing for clarification. Work done after such discovery, unless authorized by the Landscape Architect, shall be done at the Contractor's risk.
4. Contractor shall be familiar with the Remedial Action Work Plan for the project and be experienced in working on sites with historic fill.

**B. Environmental Requirements:**

1. Perform both off-site mixing and on-site soil work only during suitable weather conditions. Do not disc, rototill, or work soil when frozen, excessively wet, or in otherwise unsatisfactory condition.
2. Soil mixes shall not be handled, hauled, or placed during rain or wet weather or when wet near or above field capacity.

**C. Sequencing and Scheduling: Adjust, relate together, and otherwise coordinate work of this Section with work of Project and all other Sections of Project Specifications.**

**1.07 PRODUCT DELIVERY, STORAGE AND HANDLING**

- A. **Packaged Materials:** Deliver packaged materials to the location where soils are to be mixed, in unopened bags or containers, each bearing the name, guarantee, and trademark of the producer, material composition, manufacturers' certified analysis, and the weight of the materials. Retain packages for the Construction Manager or Owner's Representative.
- B. Soil or amendment materials stored on site temporarily in stockpiles prior to placement shall be protected from intrusion of contaminants and erosion. All temporary storage means and methods shall be approved by Owner's Representative.
- C. Blending of soil materials will be sequenced to occur no more than four (4) to six (6) weeks before delivery and placement at the project site.
- D. After blending, soil materials shall be stockpiled in a location free from contamination. Stockpiles will be left uncovered during dry periods, and covered with a tarpaulin during precipitation.

**1.08 BASE COMPONENT MATERIALS**

**A. General:**

1. Contractor is responsible to provide and install planting soil mixes on rooftop structure as indicated on the drawings.
2. All planting soil mix materials shall fulfill the requirements for new planting soil mixes as specified.
3. Samples of individual components of plant mixes and also blended plant mixes shall be submitted by the Contractor for testing and analysis to the approved testing laboratory. Include verification testing of on-site sub-soils. Comply with specific material requirements specified.
  - a. No base component material for plant mix shall be used until certified test reports by a soil scientist or agricultural chemist have been received and approved by Landscape Architect.
  - b. As necessary, make any and all soil mix amendments and resubmit test reports indicating amendments until approved.
4. Owner's Representative may request additional testing by Contractor for confirmation of Mix quality at any time until completion. See Article 1.04, herein for additional requirements.

**B. Base Component Materials**

1. Base Component Soil shall be sandy loam soil from a single source capable of supplying a consistent quantity of the specified soil material meeting the requirements of this specification. Base Component Soil shall not be site salvaged unless approved by Landscape Architect.
2. Sand shall be used as the base component material for structural soils and drainage layers. Sand will be obtained from a single, consistent source.
3. Test Base Component Materials, both individual components and mixed materials, for compliance with material specifications. These test criteria and results, when approved, shall establish the standard to which all subsequent Base Component Material tests must conform.
4. Prior to blending Base Component Material with organic matter (compost), have one (1) composite sample tested from each 500 c.y. of Base Component Material intended for use in soil mixes of lawn and planting work.
  - a. Base Component Material shall meet specified requirements. The only allowable amendments to the Base Component Material will be for adjustment of nutrient levels and then only by means established by these specifications.
  - b. Perform the following tests and submit test reports. Failure to include any of the criteria stated below will be sufficient cause for rejection of the test reports.

5. Particle size analysis/distribution by sieve analysis as defined below as well as with a hydrometer method.
6. Fertility analysis - pH, soluble salts, nitrate, phosphate, potassium, calcium and magnesium.
7. Organic matter content (% oven dry weight of soil).
8. Toxic substance content.
9. Material drainage rate.

C. Material Requirements, Sand:

1. Physical Analysis (Soil Texture):

<u>Sieve Size</u>	<u>% Passing</u>	<u>% Retained</u>	<u>Dimension Class</u>
1"	100.0	0.0	Gravel
1/4"	100.0	0.0	Fine Gravel
# 10	95 - 100	0 - 5	Very Coarse Sand
# 20	80 - 90	5 - 20	Coarse Sand
# 40	35 - 45	35 - 55	Coarse Sand
# 60	15 - 25	10 - 30	Medium Sand
# 80	5 - 15	0 - 20	Fine Sand
#100	0 - 5	0 - 10	Very Fine Sand
#200	< 2	< 2	Very Fine Sand
Pan	<1		Silt/Clay

Test results must be submitted for per-cent (%) retained as well as for per-cent (%) passing for all sieve sizes. Failure to include any of the aforementioned criteria will be cause for rejection of the test report.

2. Chemical Analysis:

- a. Organic matter content (% oven-dry weight of soil as determined by loss on ignition). Organic matter content shall be less than 1%.
- b. Soil reaction (pH) - 6.0 ( $\pm 0.5$ )

- c. Soluble salt content (conductivity) - Less than 0.5 mm hos/cm for a 1:2 soil to water ratio.
- d. Toxic substance content harmful to plant growth.
  - i) Material Drainage at a rate of 55 to 70% of the total volume of water within 3 minutes. Soil should be saturated prior to conducting test.

D. Material Requirements, Sandy Loam

1. Physical Analysis (soil texture):

<u>Sieve Size</u>	<u>% Passing</u>	<u>Retained</u>	<u>Dimension Class</u>
1"	100.0	0.0	Gravel
1/4"	100.0	0.0	Fine Gravel
# 10	98 - 100	0 - 2	Very Coarse Sand
#20	85 - 98	10 - 15	Coarse Sand
# 40	63 - 75	10 - 35	Coarse Sand
#60	40 - 55	12 - 35	Medium Sand
#80	25 - 35	15 - 30	Fine Sand
#200	20 - 30	5 - 15	Very Fine Sand
Pan		20 - 30	Silt/Clay

Test results must be submitted for percent (%) retained as well as for percent (%) passing for all sieve sizes. Failure to include any of the aforementioned criteria will be cause for rejection of the test report.

2. Chemical Analysis:

- a. Organic matter content (% oven dry weight of soil)
- b. Total content shall be within the range of 3 to 4%.
- c. Soil reaction (pH) - 6.0 ( $\pm 0.5$ )
- d. Soluble salt content (conductivity) - Less than 3.1 mm hos/cm for a 1:2 soil to water ratio.
- e. Toxic substance content harmful to plant growth.
  - i) Hydrometer Testing:
    - i. Sand – 70 - 80%

ii. Silt – 10 - 20%

iii. Clay – 5 - 15%

Note: Silt and clay percentages combined must be at least 15%, and silt cannot be more than 2x the clay content of the soil

E. Before Base Component Soil is used for mixing with amendments, handle and stockpile Base Component Soil in the following manner:

1. Homogenize to make a uniform mix, free of subsoil lenses and other irregularities.
2. Aerate the base material to make a friable planting medium.
3. Separate out and remove all clay lumps, stones, stocks, roots, and other debris.
4. No. 8 Pea Gravel

a. Pea gravel will be washed, rounded rock of 1/4" to 3/8" diameter. Pea Gravel shall conform to the following:

Sieve Size	Percent Passing by Weight
12.5 mm	100%
10 mm	90 - 100%
5 mm	0 - 10%
2 mm	0 - 1%

\* This material shall be clean naturally occurring rock

F. Material Requirements: Compost

1. Compost shall be a stable, humus-like material produced from the aerobic decomposition and curing of organic vegetative residues derived from feedstock consisting of woody stems, leaves, grass cuttings, and livestock manure (up to 10 percent of the compost mix by volume). The compost shall be a dark brown to black color and be capable of supporting plant growth with appropriate management practices with no visible free water or dust, with no unpleasant odor.

a. Chemical Properties: Compost shall conform to the following values:

Item	Units	Range
Total nitrogen	ppm	2000 - 8000
Extractable nitrate	ppm	20 -200
Total phosphorus	ppm	5 - 2000
Available phosphorus	ppm	5 - 200
pH	Std U	5.5 – 8.0
Salt concentration	dS.m-1	<6

2. The ratio of carbon to nitrogen (C:N) shall range between 10:1 to 25:1.
3. Organic matter content of compost shall be at least 40 percent (dry weight). One hundred percent of the material shall pass a 1/2-inch (or smaller) screen. Debris such as metal, glass, plastic, wood (other than residual chips), asphalt or masonry shall not be visible and shall not exceed one percent dry weight.
4. The compost shall be screened to 1/2 inch maximum particle size and shall contain no more than 3 percent material finer than 1.0mm (No. 18 sieve) as determined by sieve analysis.
5. Additional tests defined in Part I as Chemical Properties shall be performed and the results will be utilized to evaluate amendments to the planting soil mixes that may be required.
  - a. Maturity:
    - i) CO<sub>2</sub> test: Compost respiration shall be no more than 6 mg CO<sub>2</sub>-C/gBVS day.
    - ii) Reheating test: The maximum heat rise shall be no greater than 9 degree C above room temperature (20 to 25 degrees C).
    - iii) Solvita test: The compost must achieve a maturity index of 6 or more.
  - b. Biological Values:
    - i) Active bacteria and fungi are not to be higher than 10 percent of total bacteria and fungi respectfully.
    - ii) Total bacteria to be a minimum of 500 ug/g
    - iii) Total fungi to be a minimum of 400 ug/g
    - iv) Protozoa to be 100,000 (amoeba and flagellates with no more 3000 ciliates)
    - v) Nematodes minimum of 10 beneficial, no root feeders
  - c. Pathogens/Metals/Vector Attraction reduction shall meet 40 CFR Part 503 rule, Table 3, page 9392, Vol. 58 No. 32.
  - d. Heavy metal content not to exceed the following amounts:

Element	Acetate Extract	HCL Extract
Iron	0.5 ppm	3.1 ppm
Manganese	0.5 ppm	15.4 ppm
Molybdenum	0.4 ppm	0.8 ppm
Zinc	0.2 ppm	4.4 ppm
Aluminum	0.2 ppm	1.2 ppm
Boron	1.1 ppm	1.7 ppm
Copper	None	0.01 ppm
Lead	0.1 ppm	0.4 ppm
Selenium	None	0.4 ppm
Mercury	None	None
Chromium	None	None
Cadmium	None	0.02 ppm
Nickel	None	0.04 ppm
Cobalt	None	0.05 ppm

None = none detected = below detection limits of 0.01 ppm.

- e. Total available N from biological cycling: 150 lbs per acre.
- f. Test compost for compliance with material specifications including organic matter, pH, and heavy metal content. Have one (1) composite sample tested for each new source of supply, each variable pile within each source of supply, and each 500 c.y. of material or as directed by Owner's Representative.

G. Material Requirements: Expanded Shale/Clay

- 1. Expanded shale or clay is a lightweight, porous ceramic material produced by expanding and vitrifying select shale in a rotary kiln, free of organic matter and fines. Expanded shale or clay (3/4x No. 4) is a planting soil mix component.
  - a. Expanded shale/clay properties include the following:

Analysis	Units	Result	FLL Guidelines for Extensive Sites <sup>1</sup>

<i>Particle Size Distribution</i>	mass %	>	0.9	< 10
< 0.05 mm ( <i>Fll reference value based on &lt; 0.06 mm</i> )	g/cm3	>	0.82

				1.09 -15.8
				1.

<p><i>2 Total pore volume determined using measured particle density instead of assumed particle density as specified in FLL 2008. Guidelines for the Planning Execution and Upkeep of Green-Roof Sites</i></p>			

B. Mixing Procedures

1. Saturate the lightweight aggregate with water to ensure proper soil component distribution.
2. Mechanically mix appropriate proportions of remaining ingredients with the saturated aggregate until a uniform distribution is achieved.
3. When stockpiling the finished mix, cover the pile with a waterproof tarp to prevent drying out or separation of soil components from rain.
4. Material Requirements: Geofibers
  - a. Geofibers shall be discrete, fibrillated polypropylene fibers for turf soil reinforcement.
  - b. Geofibers shall conform to the following:

Property	Test Method	Requirement
Polypropylene	ASTM D4101	99% minimum
Fiber Length	Measured	2 inches

Color		Black
Specific Gravity	ASTM D792	0.91 gm/cc
Carbon Black Content	ASTM D1603	0.6%, minimum
Tensile Strength	ASTM D2256	40,000 psi
Tensile Elongation	ASTM D2256	15%, maximum
Young's Module	ASTM D3822	600,000 psi

- c. Geofibers will be packaged in sealed, waterproof 50lb bales or other approved packaging. Each bale or bag will be labeled as to its contents, including
5. Product Brand Name and Style Number
6. Name and address of manufacturer and supplier
7. Proper notifications of trademarks and/or patents
8. Net weight contents of each bag or bale
9. Material Requirements: Woven Geotextile/Filter Fabric
  - a. Filter fabric shall be a woven drainage geotextile, non-biodegradable.
  - b. The permeability of the drainage fabric shall be a minimum of 110 gal/min/sq. ft.
  - c. Filter fabric shall meet the following Minimum Average Roll Value (MARV) specifications across the weave:
10. Weight (Typical): 5.6 oz./yd<sup>2</sup>, according to ASTM D-5261
11. Grab Tensile Strength: 370 x 200 lbs., according to ASTM D-4632
12. Grab Elongation: 15% Max, according to ASTM D-4632
13. Trapezoidal Tear Strength: 115 x 75 lbs., according to ASTM D-4533
14. Puncture Resistance: 675 lbs., according to ASTM D-4833
15. Water Flow: 145 sec-1, according to ASTM 4491
16. Permittivity: 2.1 gpm / ft<sup>2</sup>, according to ASTM 4491
17. A.O.S: 40 U.S. Sieve, according to ASTM D4751
18. Percent Open Area: 10 oz./yd<sup>2</sup>, according to D4751
19. UV Resistance: 70% / 500 hours, according to ASTM D4355

#### 1.10 SOIL AMENDMENT MATERIAL

- A. Ground Limestone: Ground Limestone as a soil amendment material will only be used pending results of analysis.
1. Provide a Ground Agricultural Limestone with a minimum of 88% of calcium and magnesium carbonates.
  2. Ground Limestone material shall have a total 100% passing the 10 mesh sieve, minimum of 90% passing the 20 mesh sieve, and a minimum of 60% passing the 100 mesh sieve.

#### 1.11 HERBICIDES

- A. Herbicides: May be required for possible use if there is seed germination after sub-grade placement and prior to planting mix installation or after subsequent plant mix installation. Under no circumstances are materials to be applied without specific instruction from the Landscape Architect, or Owner's Representative.
1. Pre-Emergent and Post-Emergent Herbicides shall be approved before use for type and rate of application by the Landscape Architect and by local and state agencies with jurisdiction.

#### 1.12 PLANTING SOIL MIXES

- A. Soil Mix Types: Provide the following planting soil mix types at the locations indicated. Adequate quantities of mixed planting and light weight soil materials shall be provided to attain, after compaction and natural settlement, all design finish grades.
1. Refer to the drawings for planting mix types.
  2. Provide synthetic reinforcing fibers for plant soil mix for all turf areas.
- B. Planting Soil Blending
1. Planting soils shall consist of base sandy loam soil blended with compost in the ratios presented in the following chart. Mix ratios are approximate and shall be adjusted as required to meet the specific requirements of the planting soil mixes.

Planting Soil Mix	Soil Blending Ratios by Volume			
	Sandy Loam	Compost	Expanded Shale/Clay	Sand
Sub Soil Mix	2	0	1	0
Lawn Soil Mix	3	1	0	0
Tree/Shrub Soil	5	2	0	0
Base Sand	0	0	0	1

2. Uniformly mix ingredients as specified for each Planting Soil Mix Type (Loamy Sand, compost, and/or expanded shale/clay, and possible other materials deemed to be necessary as a result of testing) by wind rowing/tilling on an approved, clean hard surface area. *Sandy loam and compost must be blended to a uniform, homogenous mix prior to mixing with expanded shale/clay.* Compost shall be maintained moist, not wet, during mixing. Other amendments shall not be added unless approved to extent and quantity by Landscape Architect and Owner's Representative and additional tests have been conducted to verify type and quantity of amendment is acceptable.
  3. Hammer mills or blending knives are not permitted in preparation of the planting soil mixes as these processes reduce soil structural stability.
  4. When stockpiling the finished mix, cover the pile with a waterproof tarp to prevent drying out or separation of soil components from rain.
- C. On-Going Sampling and Testing of Planting Soil Mixes (Production Runs)
1. Sampling: During soil blending operations, samples shall be collected for quality assurance. Collect samples in accordance with this Specification. Each sample shall be labeled with the planting soil mix, batch number, and date of sample. Collect samples of each 500 cubic yards of planting soil mix produced immediately upon completion of each production run or as required by Owner's Representative intended for use in each type of lawn and plant mix to include the following:
    - a. Nutrient Analysis:
      2. Have nutrient levels (nitrate, nitrogen, phosphate, potassium, magnesium, calcium, ammonium, iron, and manganese) tested, and request testing laboratory recommendations for additional fertilizer requirements at both lawn and all plant areas if nutrient levels are below average.
      3. Nutrient deficiencies in soils of plant areas shall be corrected at time of installation.
      4. Nutrient deficiencies in soils of lawn areas shall be corrected both at time of lawn installations and during maintenance period as specified.
        - a. Test organic matter, pH, soluble salts.
    5. Sampling Methods: All samples shall be composite samples that are assembled from a minimum of 6 subsamples taken from the stockpiled material. Blend samples together and submit for testing the quantity required by the testing agency.
    6. Sample and perform soil tests to demonstrate that materials meet the specifications.
      - a. No planting soil mix shall be used until certified test reports by an approved Testing Agency have been approved by the Landscape Architect.

- b. The Landscape Architect may request additional testing by the Soil Blending Contractor for confirmation of mix quality and/or soil mix amendments at any time until delivery to the site.
  - c. If, at any time during the project, the planting soil components, base loam or planting soil mixes require adjustment to meet the specifications and/or performance criteria then the Soil Blending Contractor shall submit the adjusted soil components and/or mixes for testing as specified herein.
  - d. Additional testing for re-approval shall be required should any of the material sources change after initial approval.
- D. Stockpiling and Plant Mixes
  - 1. General: Stockpiling and Plant Mixes utilized for planting soil on-site, off-site and at source should be restricted to no more than the needs of what can be used in a 24-hr. period.
  - 2. Stockpiles should be no more than 6 feet in height to prevent anaerobic conditions within the pile(s). Stockpiles shall be sheltered from weather to prevent excessive water absorption and blowing by winds as approved by Owner's Representative.
  - 3. Soils shall not be stockpiled on or within the construction areas.

## **PART 3 - EXECUTION**

### **3.01 VERIFICATIONS**

- A. Prior to construction and soil placement operations at planting areas, ascertain the location of all electric cables, conduits, underdrainage systems and utility lines. Take proper precautions so as not to disturb or damage sub-surface elements. Contractor failing to take these precautions shall be responsible for making requisite repairs to damaged utilities at Contractor's own expense.
- B. Verify that required underground utilities are available, in proper location, and ready for use. Coordinate with other trades.
- C. Verify that all work requiring access through or adjacent to areas where plant mixes are to be placed has been completed and no further access will be required. In the event that access will be required, this must be coordinated with the Owner's Representative.

### **3.02 PLANTING MIXTURES**

- A. Planting soil mixes shall be of the type(s) indicated in accordance with the planting details, and shall be pre-mixed and placed as specified.
  - 1. Bring to pH levels of 6.5 +/- 0.5 standard units. pH-shall be verified by testing.

2. Lower pH by using ammonium sulfate product. Peat moss or copper sulfate may not be used to lower pH. Consult with soil scientist to determine appropriate application rates.
- B. All amendments shall be thoroughly incorporated into the mixture to assure uniform distribution. Delay mixing of fertilizers if planting will not follow within a few days.

### 3.03 PLACING PLANTING SOIL

- A. Remove all large clods, lumps, brush, roots, stumps, litter, and other foreign material and stones three-quarters inch (3/4") in diameter or larger. Dispose of removed material legally offsite.
- B. Do not place a muddy or wet soil mix.
- C. Planting soil mixes shall be placed carefully to avoid damage or displacement of other materials such as walls, paving, drainage components, filter fabric, or roofing membrane. Refer to Soil Profile Plan Sheet notes for soil placement details.
- D. Planting soil mixes soil shall be placed to within 1 inch greater than final grade or to a depth of no greater than 8 inches and compacted as described in Point c. below. For final grades less than 8 inches only one round of compaction shall be performed and remaining soil loosely placed prior to wetting (see Point e. below). For final grades greater than 8 inches, place soil at no greater than 6 inches and repeat procedure until soil has been compacted within 1 inch of final grade. The remaining soil shall be loosely placed at 1 inch greater than final grade and wetted.
- E. Compaction shall be performed with a 200 – 300 lb. landscape roller or lightly compacted with a hand held mechanical compactor to achieve a 75 - 80% compaction as determined by ASTM D1557. Dry soil density shall not exceed 1.35 g/cm<sup>3</sup> (85 lbs/cf)
- F. After compaction remaining soil shall be placed and thoroughly watered or jetted over entire area. Fill settled low areas with additional soil and re-wet to achieve uniform prescribed final grade.
- G. Placement of Geocells: For geogrid that is installed between the tree planting soil and the porous surface material, the Contractor shall ensure the geocells remains level relative to its position.

### 3.04 TESTING

- A. After installation, perform in-situ soil density and double-ring infiltrometer tests in conformance with Part 1 of this specification. Remediate any areas that exceed the specified compaction rate or that fail to drain within the specified rate. Remediation shall include de-compaction, aeration, or full replacement of the affected soil areas.
  - a. Standard Proctor Density Test: Conforming to ASTM D698 Standard Test Methods for Laboratory Compaction Characteristics of Soil Using Standard Effort
    - i) Density Tests (Compaction):

2. Nuclear Method: ASTM D6938 - 10 Standard Test Method for In-Place Density and Water Content of Soil and Soil-Aggregate by Nuclear Methods (Shallow Depth).
  - a. Infiltration Test: Double ring infiltrometer, falling head, conforming to ASTM D3385-09
    - i) Infiltration rate shall be minimum 1.5"/hr.

**END OF SECTION 329113**

## **SECTION 330510 - OTHER UTILITIES**

### **PART 1 GENERAL**

#### **1.1 SCOPE OF WORK**

Work under this Section shall consist of providing all labor, plant facilities, materials and equipment necessary and required to install the gas, electric, telephone and cable television facilities in accordance with the Contract Documents. This Work shall include but not be limited to:

- A. Installation of on-site utilities consisting of pipe, conduit and all necessary and required accessory items and operations associated with said installation.
- B. Coordinate with the utility companies regarding the installation of utilities within the right-of-way and on-site as required, including connections to existing facilities.

#### **1.2 RELATED SECTIONS**

- A. Section 011100 - General Requirements, as related to As-Built Requirements
- B. Section 312000 - Earthwork
- C. Local Utility Companies and Governing Agencies
- D. Contract Documents

#### **1.3 COORDINATION**

- A. All work under this Section shall be coordinated with the gas, electric and telephone utility company and shall comply with all requirements, details, regulations, etc. of said utility company. The Contractor shall coordinate with each utility to define where his limit of work exists before submitting a bid price for this Section.
- B. Work shall be coordinated with the electrical and/or mechanical contractors responsible for building and light standard connections.

### **PART 2 PRODUCTS**

#### **2.1 GENERAL**

- A. When available, those materials specified by the appropriate utility company shall be used in lieu of those materials specified in this Section.

#### **2.2 GAS PIPING**

- A. All gas pipe, fittings, joints and valves shall comply with all requirements, regulations, specifications and recommendations of the gas company.

#### **2.3 ELECTRIC, TELEPHONE AND CABLE DUCTBANK**

- A. Concrete ductbank shall comply with all requirements of applicable utility companies.

2.4 MANHOLE/PULL PITS

- A. All manholes and pull pits required by the utility company shall comply with all requirements, regulations, specifications, details, and recommendations of said utility company.

**PART 3 EXECUTION**

3.1 CONSTRUCTION

- A. General:

The Contractor shall install all pipe, conduit and ductbank in the locations as shown on the Drawings and/or as approved by the Owner's Engineer and utility company. Pipe and conduit shall be of the type and sizes specified and shall be laid accurately to line and grade. Any necessary structures shall be accurately located and properly oriented.

- B. Excavation and Backfill:

1. When available, those requirements, specifications and procedures, for excavation and backfill, specified by the appropriate utility company shall be used in lieu of these specifications. When such specifications are not available from said utility company, the requirements of this specification shall apply.
2. The provisions of Section 312000 entitled "Earthwork" shall govern Work under this Section.

- C. Storage and Handling of Conduit and Pipe:

All pipe and conduit shall be protected against impact, shock and free fall, and only equipment of sufficient capacity and proper design shall be used in handling. Storage of pipe and conduit on the job shall be in accordance with manufacturer's recommendations, subject to the approval of the Owner's Engineer.

- D. Damage to Pipe and Conduit:

Pipe or conduit which is defective from any cause, including damage caused by handling, and determined by the Owner's Engineer as unrepairable, shall be unacceptable for installation and shall be replaced at no cost to the Owner as directed by the Owner's Engineer.

Pipe or conduit that is damaged or disturbed through any cause prior to acceptance of the Work shall be repaired, realigned or replaced as directed by the Owner's Engineer, at the Contractor's expense.

- E. Pipe Installation:

1. All piping and conduit shall be laid in accordance with the requirements and procedures specified by the appropriate utility company. When such requirements are not available from said utility company, the requirements of this specification

shall apply.

2. Each length of pipe and conduit shall be laid with firm, full and even bearing throughout its entire length, in a trench prepared and maintained in accordance with Section 312000. Every length of pipe shall be inspected and cleaned of all dirt and debris before being laid. The interior of the pipe and the jointing seal shall be free from sand, dirt and trash before installing the line. Minimum cover over the top of the pipe or conduit shall comply with the utility specifications and shall never be less than 2-ft.
3. Bedding and Backfilling: The type of materials to be used in bedding and backfilling and the method of placement shall comply with the requirements and procedures specified by the appropriate utility company. When such requirements are not available, the type of materials to be used in bedding and backfilling and the method of placement shall conform to the requirements of these specifications and as shown on the Details of the Drawings.
4. Protection During Construction: The Contractor shall protect the installation at all times during construction, and movement of construction equipment, vehicles and loads over and adjacent to any pipe shall be performed at the Contractor's risk.

At all times when pipe laying is not in progress, all open ends of pipes shall be closed by temporary watertight plugs. If water is in the trench when work is resumed, the plug shall not be removed until the trench has been pumped dry and all danger of water entering the pipe has passed.

F. Pipe/Conduit Joints:

1. When available, those specifications and requirements specified by the appropriate utility shall be used in lieu of these specifications. Where such specifications are not available from said utility company, the requirements of this specification shall apply.
2. All joints are to be made watertight in accordance with the requirements specified herein. Pipe shall be jointed in strict accordance with the Pipe manufacturer's instruction. Jointing of all pipe shall be done entirely in the trench. Assembly of PVC conduit shall be with a solvent type adhesive as recommended by the conduit manufacturer.

G. Manholes/Pull Pits:

Any manholes or pull pits required by the appropriate utility shall be fabricated, bedded, located and backfilled in accordance with said utility requirements and recommendations. Final location(s) shall be approved by the Owner's Engineer.

H. Connection to Existing Facilities:

1. General: The Contractor shall make all required connections of the proposed gas lines into existing gas facilities, where and as shown on the Contract Documents and/or as approved by the gas company.

The Contractor shall terminate the upstream end of the electric and telephone conduit at a location specified by the electric and telephone companies.

2. Compliance with Requirements of Owner of Facility: Connections into existing facilities shall be performed in accordance with the requirements of the owner of the facility. The Contractor shall be required to comply with all such requirements, including securing of all required permits, and paying the costs thereof. The cost of making the connections in accordance with the requirements of the Owner of the existing facility shall be included in the Contract Sum.
3. Cable pulling and connection of wire and cable to the existing facilities is not covered under this specification and will be done by others.

I. Construction within the Public Right-Of-Way:

Construction within the public right-of-way shall conform to all requirements of the Borough of North Haledon Representative Engineer and any other agencies having jurisdiction.

J. Service Lines:

1. The Contractor shall install gas piping and electric/telephone conduit to points located 5-ft outside the proposed building lines as shown on the Drawings. All pipes and conduit shall be properly sealed with watertight plugs and shall be clearly marked from above.
2. The Contractor will be required to coordinate his work with the work of the Building Contractor to determine the exact location and elevation of the point of entry into the building. If the Building Contractor has installed his portion of the service lines, Work under this Contract shall also include final connections of the service lines 5-ft outside the building line to the building service line at no additional cost to the Owner.

3.2 . INSPECTION AND TESTING

- A. The Contractor shall perform all inspection and testing of these installations as required by the appropriate utility company and shall bear all costs arising therefrom.

3.3 FINAL INSPECTION

- A. Upon completion of the Work and before final acceptance by the Owner, these installations may be subjected to a final inspection in the presence of the Owner's Engineer, a Borough of North Haledon Representative Engineer or a representative of the utility company. The Work shall not be considered as completed until all requirements for line, grade, cleanliness, tests and workmanship have been met.

**END OF SECTION 330510**

\\languan.com\data\PAR\data2\101053201\Project Data\Specifications\FOR BID\330510 Other Utilities.docx

## **SECTION 331000 - PROTECTION OF EXISTING UTILITIES**

### **PART 1 GENERAL**

#### **1.01 SCOPE OF WORK**

- A. Identification and field mark out of all on-site utility lines to remain in operation during construction.
- B. Identification and field markout of all off-site utility lines within construction work areas.
- C. Submission of procedures to be used to ensure the safety of the utility.
- D. Conduct test pit excavation at all proposed utility crossings prior to construction.
- E. Repair of any damage during construction operations.
- F. Relocate utilities that are indicated as such.

#### **1.02 RELATED SECTIONS AND DOCUMENTS**

- A. Section 311000 – Site Preparation
- B. Section 024119.1 – Site Demolition
- C. Section 312000 – Earthwork
- C. Contract Drawings

#### **1.03 PROJECT RECORD DOCUMENTS**

- A. Accurately record actual locations of capped utilities and utility lines encountered during construction.
- B. Accurately record actual locations and elevations of existing utilities at proposed utility crossings prior to utility and storm sewer construction. Submit recorded data to Owner's Engineer for verification of proposed design.

#### **1.04 REGULATORY REQUIREMENTS**

- A. Contractor shall notify all affected utility companies, agencies, authorities, owners, etc. at least 48 hours prior to the commencement of work or as required by each agency and shall comply with their requirements.
- B. Contractor shall contact the "New Jersey One Call System", 811 or (800) 272-1000, service for an official utility mark out.

### **PART 2 PRODUCTS**

NOT APPLICABLE

## **PART 3        EXECUTION**

### **3.01    IDENTIFICATION**

- A.     Locate all existing utilities which are to remain in service and/or require relocating during construction as shown on the Contract Drawings.

### **3.02    PROTECTION**

- A.     Flag, barricade or suitably protect existing utilities during construction operations and equipment movement. Install shoring and bracing as required.
- B.     Prevent interruption of existing utility service to occupied or used facilities, except when authorized in writing by authorities having jurisdiction.

### **3.03    LATERAL DISCONNECTION**

- A.     Where a utility line is to be disconnected from portions to remain, the lateral pipes shall be cut and suitably plugged/capped in accordance with the Contract Drawings and applicable utility or agency requirements.

### **3.04    REPAIRS**

- A.     Any damage to existing, operational utilities by the Contractor or his subcontractors during the on-going construction operation shall be immediately repaired to operational standards at the Contractor's expense. If the repairs are not immediately addressed by the Contractor, the utility owner and/or the Owner shall have the right to contract for the repair at the Contractor's expense.

### **3.05    RELOCATIONS**

- A.     Where utility lines are designated to be relocated, construct new utilities as shown and in accordance with these specifications and then remove former service to minimize disruption to the best extent practical. This operation shall be coordinated with the appropriate Authorities, as necessary.

## **END OF SECTION 331000**

## SECTION 332200 - WATER DISTRIBUTION SYSTEMS

### PART 1 GENERAL

#### 1.01 SECTION INCLUDES

- A. Site water piping and fittings including domestic potable waterline and fire protection system supply waterline, valves, and fire hydrants.
- B. Connection of site water system to municipal water systems.

#### 1.02 RELATED SECTIONS

- A. Section 312000 - Earthwork
- B. Construction Drawings

#### 1.03 REFERENCE STANDARDS

- A. American Society of Mechanical Engineers (ASME) latest edition
  - 1. B 16.22 Wrought Copper and Copper Alloy Solder Joint Pressure Fittings
- B. American Society for Testing and Materials (ASTM) latest edition
  - 1. B 88 Seamless Copper Water Tube
  - 2. D 1784 Rigid Poly (Vinyl Chloride) (PVC) Compounds and Chlorinated Poly (Vinyl Chloride) (CPVC) Compounds
  - 3. D 2241 Poly (Vinyl Chloride) (PVC) Pressure-Rated Pipe (SDR-Series)
  - 4. D 2564 Poly (Vinyl Chloride) (PVC) solvent cement
  - 5. D 2672 Poly (Vinyl Chloride) (PVC) integrally molded bell ends for solvent - cemented pipe joints.
  - 6. D 2855 Making Solvent-Cemented Joints with Poly (Vinyl Chloride) (PVC) Pipe and Fittings
  - 7. D 3139 Joints for Plastic Pressure Pipes using Flexible Elastomeric Seals
  - 8. F 477 Elastomeric gaskets and lubricant
  - 9. F 656 Poly (vinyl chloride) (PVC) cement Primer
- C. American National Standards Institute (ANSI) latest edition
  - 1. A21.8
- D. American Water Works Association (AWWA) latest edition
  - 1. C104 Cement-Mortar Lining for Ductile-Iron Pipe and Fittings for Water
  - 2. C105 Polyethylene Encasement for Ductile-Iron Piping for Water and Other Liquids
  - 3. C110 Ductile-Iron and Gray-Iron Fittings, 3 Inches Through 48 Inches, for Water and Other Liquids
  - 4. C111 Rubber-Gasket Joints for Ductile Iron Pressure Pipe and Fittings
  - 5. C151 Ductile-Iron Pipe, Centrifugally Cast, for Water or Other Liquids

6. C200 Steel Water Pipe 6 Inches and Larger
7. C500 Gate Valves for Water and Sewage Systems
8. C502 Dry-Barrel Fire Hydrants
9. C504 Rubber-Seated Butterfly Valves
10. C600 Installation of Ductile-Iron Water Mains and Appurtenances
11. C606 Grooved and Shouldered Joints
12. C651 Disinfecting Water Mains
13. C900 Polyvinyl Chloride (PVC) Pressure Pipe, 4 Inches Through 12 Inches, for Water Distribution

- E. National Fire Protection Associations (NFPA)
1. NFPA 13 Installation of Sprinkler Systems
  2. NFPA 24 Installation of Private Fire Service Mains and Their Appurtenances

#### **1.04 QUALITY ASSURANCE**

- A. Products, where marked for compliance with code or test standards, shall also mark specific standard as required in the Contract Documents.
- B. Perform installation in accordance with utility company and municipality requirements.
- C. Valves: Manufacturer's name and pressure rating marked on valve body.
- D. Perform disinfection of potable lines in accordance with AWWA C651.

#### **1.05 SUBMITTALS**

- A. Product Data: Provide Engineer with data on pipe materials, pipe fittings, hydrants, valves, and accessories.
- B. Manufacturer's Certificate: Certify that products meet or exceed state or local requirements.
- C. Furnish 1 copy of results of meter test and hydrostatic pressure test to Owner and utility company upon completion of water distribution backfilling operations.

#### **1.06 PROJECT CONDITIONS**

- A. Coordinate work with connection of water/sewer/storm sewer service outside building to maintain water service to affected parties, including the operating store. Contractor to notify affected parties 48 hours prior to interruption of any services.

### **PART 2 PRODUCTS**

#### **2.01 PIPE AND FITTINGS**

- A. Pipe sizes 3-inches and smaller for installation below grade and outside building shall comply with one or combination of following:
  - 1. Seamless Copper Tubing: Type "K" soft copper, ASTM B88.
    - a. Fittings: Wrought copper (95-5 Tin Antimony solder joint), ASME B 16.22.
  - 2. Polyvinyl Chloride (PVC) Water Pipe: Pipe, ASTM D 2241, with SDR 21 rating, continually marked with manufacturer's name, pipe size, cell classification, SDR rating, and ASTM D1784 material classification.
    - a. Pipe joints: Integrally molded bell ends, ASTM D2672.
    - b. Cement primer: ASTM F656.
    - c. Solvent cement: ASTM D2564.
- B. Pipe sizes 4 to 16 inches for installation below grade and outside building shall comply with one or combination of following:
  - 1. Ductile Iron Water Pipe: AWWA C151, Pressure class 350 (4-12") Pressure Class 250 (14-16").
    - a. Fittings: Either mechanical joint or push-on joint, AWWA C153, and shall be coated with a 6-8 mil nominal thickness fusion bonded epoxy conforming to the requirements of AWWA C550 and C116, or cement mortar lined in accordance with AWWA C104.
    - b. Elastomeric gaskets and lubricant: ASTM F477.
  - 2. Polyvinyl Chloride (PVC) Water Pipe: Pipe, AWWA C900, rated DR 18 (Class 150), continually marked as required.
    - a. Elastomeric gaskets and lubricant: ASTM F477 for smaller pipes.
    - b. Pipe joints: Integrally molded bell ends, ASTM D3139.

## 2.02 GATE VALVES - 2-Inches and Larger

- A. Manufacturer and Model: Mueller Resilient Wedge Gate Valves or approved equal.
- B. AWWA C509, iron body, non-rising stem with square nut, single wedge, resilient seat, flanged or mechanical joint ends, control rod, post indicator where indicated on Construction Drawings, extension box and valve key.

## 2.03 BALL VALVES - 2-Inches and Smaller

- A. Manufacturers: Mueller Oriseal or approved equal.
- B. Brass body, teflon coated brass ball, rubber seats and stem seals, Tee stem pre-drilled for control rod, AWWA compression inlet end, compression outlet with electrical ground connector, with control rod, extension box and valve key.

## 2.04 BUTTERFLY VALVES - from 2-Inches to 24-Inches

- A. AWWA C504, Iron body, bronze disc, resilient replaceable seat, water or lug ends, infinite position lever handle.

## 2.05 CHECK VALVES, POST INDICATOR VALVES, and BACKFLOW PREVENTORS

- A. Refer to Fire Suppression in Architectural/Building Specifications

## 2.06 FIRE HYDRANTS ASSEMBLIES

- A. Fire Hydrants: Type as required by utility company/Local Fire Department and as shown on Construction Drawings.
- B. Hydrant Extensions: Fabricate in multiples of 6-inches with rod and coupling to increase barrel length.
- C. Hose and Steamer Connections: Match sizes with utility company, with two hose nozzles, one pumper nozzle.
- D. Finish: Apply primer and 2 coats of enamel or special coating to color as required by utility company.

## 2.07 ACCESSORIES

- A. Thrust Blocking: Place 3000 psi concrete to provide sufficient bearing area to transmit unbalanced thrust from bends, tees, caps, or plugs to undisturbed soil without loading undisturbed soil in excess of 2,500 pounds per square foot when water main pressure is 200 psi. In addition to thrust blocks the contractor shall use restrain mechanical joints at all fittings

HORIZONTAL THRUST BLOCKS

## PART 3 EXECUTION

### 3.01 EXAMINATION

- A. Verify that building service connection and municipal utility water main size, location, and depth are as indicated on Construction Drawings.

**3.02 PREPARATION**

- A. Ream pipe and tube ends and remove burrs.
- B. Remove scale and dirt, on inside and outside, before assembly.
- C. Prepare pipe for connections to equipment with flanges or unions.
- D. Protect benchmarks, property corners, and other survey monuments from damage or displacement. If marker needs to be removed it shall be referenced by licensed land surveyor and replaced, as necessary, by same.

**3.03 BEDDING**

- A. Excavate pipe trench and place bedding material in accordance with Section 312000

**3.04 INSTALLATION - PIPE, FITTINGS AND VALVES**

- A. Maintain separation of water main from sanitary and storm sewer piping in accordance with state or local codes.
- B. Install pipe and fittings in accordance with AWWA C600.
- C. Install pipe to allow for expansion and contraction without stressing pipe or joints or as specified by pipe manufacturer.
- D. Install water pipe, fittings and valves in conformance with AWWA C600.
- E. Connections with Existing Private Pipelines: Where connections are made between new work and existing private piping, make connection using suitable fittings for conditions encountered. Make each connection with existing pipe at time and under conditions with least interference with operation of existing pipeline and in compliance with local utility company.
- F. Form and place concrete for thrust blocks or other specified methods of retainage at each change of direction or end of pipe main.
- G. Establish elevations of buried piping in accordance with Section 312000.
- H. Install trace wire continuous over top of non-metal pipe. Bury a minimum of 6 inches below finish grade, and above pipeline.

**3.05 DISINFECTION, TESTING, FLUSHING AND SAMPLING OF DOMESTIC WATER PIPING SYSTEM**

- A. Disinfect distribution system with chlorine before acceptance for domestic operation. Chlorine dosage shall be not less than 50 parts per million. Flush lines before introduction of chlorinating materials and after contact period of not less than 24 hours. Flush with clean water after contact period until residual chlorine content is not greater than 1.0 part per million. Flush water discharged from water supply lines or hydrants shall not be allowed to discharge directly onto exposed soil or turf which could result in erosion of soil. If potential

for erosion exists at discharge point, measures shall be taken to prevent erosion. Open and close valves in lines being disinfected several times during contact period. After disinfection, take water sample and bacteriological test in accordance with AWWA C651. Do not place distribution system in service until approval is obtained from local governing authorities.

- B. Contractor shall provide a means of neutralizing the super chlorinated water before releasing into the environment. This may be accomplished by either a method of dechlorinization, direct release into a detention area or any method acceptable to federal, state, and local codes. Direct release to open ground shall not be allowed, unless contained within an on-site detention facility with 6" permanent storage. In this case, the Contractor shall time the release to assure that no rainstorms are imminent. The intent of this condition is to allow the majority of the chlorine to evaporate into the atmosphere before a rainstorm has the opportunity to wash the residual downstream. Contractor shall not release super chlorinated water directly into the sanitary sewer system, private or public, nor any storm drain system not directly discharging into the detention facility.

**END SECTION 332200**

\\langan.com\data\PAR\data2\101053201\Project Data\Specifications\FOR BID\332200 Water Distribution Systems.docx

## **SECTION 332334 – EXCAVATION, BACKFILL AND COMPACTION FOR PAVEMENT**

### **PART 1 - GENERAL**

#### **1.01 SUMMARY**

- A. Excavation to line, grade, and configuration as shown on Construction Drawings for proposed and future pavement areas.
- B. Fill to line, grade, and configuration as shown on Construction Drawings for proposed and future pavement areas.
- C. Compacting fill materials in acceptable manner as specified herein.

#### **1.02 RELATED SECTIONS**

- A. Section 312200 – Earthwork
- B. Section 321123 - Aggregate Materials
- C. Section 321124 - Base Course
- D. Section 321216 - Asphaltic Concrete Paving
- E. Section 321000 - Curbs and Sidewalks
- F. Construction Drawings

#### **1.03 REFERENCE STANDARDS**

- A. See Section 312200

#### **1.04 QUALITY ASSURANCE**

- A. Independent Testing Laboratory, selected and paid by Owner, will be retained to perform construction testing on filling operations and subgrade analysis as specified in Section 312200 and as specified herein.
- B. Testing shall be in accordance with Part 3, Section 3.07, “Field Quality Control”.

#### **1.05 SUBMITTALS**

- A. Shop drawings or details pertaining to excavating and filling for pavement are not required unless otherwise shown on Construction Drawings or if contrary procedures to Construction Documents are proposed.
- B. Submit 30-pound sample of each type of off-site fill material that is to be used in backfilling in air-tight container to independent testing laboratory or submit gradation and certification of aggregate material that is to be used to independent testing laboratory for review.

## PART 2 - PRODUCTS

### 2.01 MATERIALS

- A. Fill material from off-site as specified in Section 310100 and approved by Owner.
- B. Aggregate material as specified in Section 321123.

### 2.02 EQUIPMENT

- A. Transport off-site materials to project using well-maintained and operating vehicles. Once on site, transporting vehicles shall stay on designated haul roads and shall at no time endanger improvements by rutting, overloading, or pumping.

## PART 3 - EXECUTION

### 3.01 PREPARATION

- A. Identify lines, elevations, and grades necessary to construct pavements, curb, curb and gutter, bases, sidewalk, and roadways as shown on Construction Drawings.
- B. Protect benchmarks, property corners, and other survey monuments from damage or displacement. If marker needs to be removed it shall be referenced by licensed land surveyor and replaced, as necessary, by same.
- C. Locate and identify site utilities that have previously been installed and protect from damage.
- D. Locate and identify existing utilities that are to remain and protect from damage.
- E. Over excavate and properly prepare areas of subgrade that are not capable of supporting proposed systems. Stabilize these areas by using acceptable geotextile fabrics or aggregate material.

### 3.02 EXCAVATION

- A. Excavate roadway and pavement areas to line and grade as shown on Construction Drawings.
- B. Place suitable material into project fill areas as specified in Section 310100.
- C. Unsuitable excavated material is to be disposed of in manner and location that is acceptable to Owner and local governing agencies.
- D. Perform excavation using capable, well-maintained equipment and methods acceptable to Owner and local governing agencies.

### 3.03 FILLING AND SUBGRADE PREPARATION

- A. Areas exposed by excavation or stripping and on which subgrade preparations for paving are to be performed, including future pavement areas, shall be scarified to minimum depth of 8-inches and compacted to minimum of 98 percent of optimum density, in accordance with ASTM D 698 (or 95 percent of optimum density, in accordance with ASTM D 1557) at moisture content of not less than 1 percent below and not more than 3 percent above optimum moisture content. Proofroll these areas to detect areas of insufficient compaction. Accomplish proofrolling by making minimum of 2 complete passes with fully-loaded tandem-axle dump truck with a maximum loaded weight of 20 tons, or approved equal, in each of 2 perpendicular directions under supervision and direction of the independent testing laboratory. Excavate and recompact areas of failure as specified herein.
- B. Place fill materials used in preparation of the subgrade in lifts or layers not to exceed 8-inches loose measure and compacted to minimum density of 98 percent of optimum density, in accordance with ASTM D 698, (or 95 percent of optimum density, in accordance with ASTM D 1557) at moisture content of not less than 1 percent below and not more than 3 percent above optimum moisture content.
- C. Following table stipulates maximum allowable values for plasticity index (PI) and liquid limit (LL) of suitable fill materials to be used in specified areas, unless specifically stated otherwise on Construction Drawings:

	<u>PI</u>	<u>LL</u>
*Paving Area, below upper two feet	20	50
*Paving Area, upper two feet	15	40

(\*References to depth are to proposed subgrade elevations)

- D. Fill material imported from off-site or fill material removed from onsite cut areas shall have CBR or LBR value equal to or greater than pavement design subgrade CBR or LBR value indicated on Construction Drawings.

### 3.04 COMPACTION

- A. Maintain optimum moisture content of fill materials as specified herein to attain required compaction density.
- B. Test materials in accordance with Section 312200.
- C. Corrective measures for non-complying compaction: Remove and recompact deficient areas until proper compaction is obtained at no additional expense to Owner.

### 3.05 MAINTENANCE OF SUBGRADE

- A. Verify finished subgrades to ensure proper elevation and conditions for construction above subgrade.

- B. Protect subgrade from excessive wheel loading during construction including concrete trucks, dump trucks, and other construction equipment.
- C. Remove areas of finished subgrade found to have insufficient compaction density to depth necessary and replace in manner that will comply with compaction requirements by use of material equal to or better than best subgrade material on site. Surface of subgrade after compaction shall be hard, uniform, smooth, stable, and true to grade and cross-section.

### 3.06 FINISH GRADING

- A. Finish grading shall be in accordance with Section 312200 and as specified herein.
- B. Check grading of paving areas by string line from grade stakes (blue tops) set at not more than 50-foot centers. Tolerances of 0.10-foot, more or less, will be permitted. Contractor is to provide engineering and field staking necessary for verification of lines, grades, and elevations.

### 3.07 FIELD QUALITY CONTROL

- A. See Section 312200, 3.24, "Field Quality Control".

## PART 4 - MEASUREMENT AND PAYMENT

### 4.01 MEASUREMENT AND PAYMENT

The price bid for all excavation, backfill, compaction and testing as described in Section 332334 Excavation, Backfill, and Compaction for Pavement shall be included in the respective Items that require excavation, backfill and compaction in order to properly complete all Contract work.

### END OF SECTION

\\langan.com\data\PAR\data2\101053201\Project Data\Specifications\FOR BID\332334 Excavation, Backfill, and Compaction for Pavement.doc

## SECTION 334100 - STORM DRAINAGE

### PART 1 GENERAL

#### 1.01 SECTION INCLUDES

- A. Site storm sewer drainage piping, fittings, accessories, and bedding.
- B. Connection of building and site storm water drainage system to municipal storm sewers.
- C. Catch basins, paved area drainage, site surface drainage, and stormwater detention facilities.

#### 1.02 RELATED REQUIREMENTS

- A. Section 312000 - Earthwork
- B. Section 312200 – Erosion and Sedimentation Control
- C. Section 334300 - Sewer Manholes, Frames, and Covers
- D. Construction Drawings

#### 1.03 REFERENCE STANDARDS

- A. American Association of State Highway and Transportation Officials (AASHTO) latest edition
  - 1. M36 Zinc Coated (Galvanized) Corrugated Iron or Steel Culverts and Under Drains
  - 2. M190 Bituminous Coated Corrugated Metal Culvert Pipe and Arches
  - 3. M252 Corrugated Polyethylene Drainage Tubing, 3 to 10 Inch Diameter
  - 4. M294 Corrugated Polyethylene Drainage Tubing, 12 to 36 Inch Diameter
- B. American Society for Testing and Materials (ASTM) latest edition
  - 1. A74 Cast Iron Soil Pipe and Fittings
  - 2. A185 Steel welded Wire Fabric, Plain, for Concrete Reinforcement
  - 3. A615 Deformed and Plain Billet-Steel Bars for Concrete Reinforcement
  - 4. A746 Ductile Iron Gravity Sewer Pipe
  - 5. C 76 Reinforced Concrete Culvert, Storm Drain, and Sewer Pipe
  - 6. C150 Portland Cement
  - 7. C206 Finished Hydrated Lime
  - 8. C443 Joints for Circular Concrete Sewer and Culvert Pipe, Using Rubber Gaskets
  - 9. C478 Precast Reinforced Concrete Manhole Sections
  - 10. C564 Rubber Gasket for Cast Iron Soil Pipe and Fittings
  - 11. C969 Infiltration and Exfiltration Acceptance Testing of Installed Precast Concrete Pipe Sewer Lines

- 12. D 3034 Type PSM Polyvinyl Chloride (PVC) Sewer Pipe and Fittings
- 13. D3212 Joints for Drain and Sewer Plastic Pipes Using Flexible Electrometric Seals
- 14. D3350 Polyethylene Plastic Pipe and Fitting Materials
- 15. F477 Electrometric Seals (Gaskets) for Joining Plastic Pipe

- C. American Concrete Institute (ACI)
  - 1. ACI 301 Structural Concrete for Buildings

#### 1.04 SUBMITTALS

- A. Product Data: Provide data on pipe materials, pipe fittings, and accessories. Provide shop drawings for precast inlets, catch basins and junction boxes.
- B. Manufacturer's Certificate: Certify that products meet or exceed specified local requirements.
- C. Contractor shall submit shop drawings in conformance with Section 011100.

#### 1.05 PROJECT RECORD DOCUMENTS

- A. Accurately record actual locations of pipe runs, connections, catch basins, cleanouts, and invert elevations.
- B. Identify and describe unexpected variations to subsoil conditions and location of uncharted utilities.

#### 1.06 PROJECT CONDITIONS

- A. Coordinate work with termination of storm sewer connection outside building including connection to municipal storm sewer system.

## **PART 2 PRODUCTS**

#### 2.01 SEWER PIPE MATERIALS AND FITTINGS

- A. Reinforced Concrete Pipe (RCP): ASTM C 76, Class III, wall B (Class V under Railroads) except as noted on Construction Drawings, installed with flexible plastic, bitumen gaskets at joints.
  - 1. Gaskets: Joint material for RCP shall be rubber gasket conforming to the requirements of ASTM C443 or "tongue and groove" type filled with cement mortar.
  - 2. Flared end sections shall be class 1
- B. Polyvinyl Chloride (PVC) Pipe: ASTM D 3034, rated SDR 35, continually marked with manufacturer's name, pipe size, cell classification, SDR rating, and ASTM D 3034 classification. Only permitted when specifically indicated on Construction Drawings.

1. Pipe joints: Joints for PVC shall conform to ASTM 3212 using restrained gasket conforming to ASTM F477.
- C. High Density Polyethylene Pipe (HDPE) Smooth Interior: AASHTO Designation M252 and M294, maximum diameter of 60-inches. Only permitted when specifically indicated on Construction Drawings. Pipe shall be installed in accordance with pipe manufacturer's installation Guidelines for Culvert Storm Drainage Applications.
  1. Pipe Joints and fittings shall conform to AASHTO M252 and M294.
  2. Acceptable manufacturers: Advanced Drainage Systems, Inc. "ADS N-12", HANCOR, INC. "Hi-Q", or approved equal.
  3. Gaskets are not required unless specifically called out on the Construction Documents.
- D. Ductile Iron Pipe (DIP): shall conform to ASTM A746
  1. Fittings shall be cast iron conforming to ASTM A74
  2. Joint material for DIP shall be a rubber gasket conforming to the requirements of ASTM C564 for compression joints.
- E. Subdrains: shall be perforated, PVC or Flexible corrugated plastic pipe as specified herein of the size indicated on the construction drawings.

## 2.02 INLETS, CATCH BASINS AND JUNCTION BOXES

- A. Lid and frame per details shown on Construction Drawings.
- B. Structure construction in accordance with details shown on Construction Drawings and as per the Structural Engineer.
- C. Cast-In-Place concrete for drainage structures including: manholes, inlets, catch basins, collars, support blocks, headwalls and paved ditches shall conform to ACI 301 and applicable reference specification therein and the following:
  1. Compressive Strength – 3000 psi at 28 days.
  2. Reinforcement – ASTM A615, grade 40 or 60 deformed reinforcing bars. Or A185 for wire fabric
- D. Cement Mortar used for paving inverts, filling lift holes, joints, patching and anchoring castings shall consist of one part portland cement, type I, ASTM C150, 1/4 part hydrated lime, ASTM C206 and 2-1/2 parts clean, well-graded sand and water free of suspended matter, alkali, and containing no industrial or domestic waste.

## PART 3 EXECUTION

### 3.01 EXAMINATION

- A. Verify that trench cut and excavation is ready to receive work and excavations, dimensions, and elevations are as indicated on Construction Drawings.

### 3.02 PREPARATION

- A. Hand trim excavations to required elevations. Correct over excavation with bedding material.
- B. Remove large stones or other hard matter that could damage piping or impede consistent backfilling or compaction.
- C. Protect benchmarks, property corners, and other survey monuments from damage or displacement. If marker needs to be removed it shall be referenced by licensed land surveyor and replaced, as necessary, by same.

### 3.03 BEDDING

- A. Excavate pipe trench and place bedding material in accordance with Section 312000.

### 3.04 INSTALLATION - PIPE

- A. The pipe shall be inspected for defects and cracks before being carefully lowered into the trench, piece by piece. Any defective, damaged or unsound pipe or any pipe that has had its grade disturbed after laying shall be taken up and replaced. Open ends shall be protected with a stopper to prevent earth or other material from entering the pipe during construction. The interior of the pipe shall be free from dirt, excess water and other foreign materials as the pipe laying progresses, and left clean at the completion of the installation.
- B. Installation shall commence at the lowest point for each segment of the route. RCP shall be laid with the groove or bell end upstream. Riveted CSP shall be placed with the inside circumferential laps pointing downstream. Applying bituminous material conforming to AASHTO M190 shall repair damaged bituminous coating on CSP.
- C. Lay pipe to the required line and slope gradients with the necessary fittings, bends, manhole, risers and other appurtenances placed at the required location as noted on Construction Drawings.
- D. Do not displace or damage pipe when compacting.
- E. No pipe shall be laid in water or when trench conditions are unsuitable for such work.
- F. Joints:
  - 1. Joints shall be constructed as described herein with the intent that they be made watertight.
  - 2. For RCP, the joint surface shall be cleaned and washed with water, if necessary, before the joints are made. For tongue and groove joints in smaller sizes, butting the inside of the bell with a cement mortar before joining shall make the joints. The inside joint can be wiped clean of excess mortar by brush or a squeegee drawn through the pipe as the laying operations progress. In the larger diameters, which permit the entry of a man, an annular space is provided between pipe

sections which shall be completely filled with mortar and finished off smooth with the inside surface of the pipe.

### 3.05 INSTALLATION - CATCH BASINS, INLETS, AND JUNCTION BOXES

- A. Precast Sections:
  - 1. Precast section with bases shall be installed in accordance with Section 312000 and 334300 or as shown on construction drawings.
  - 2. Pipe openings shall be aligned to that of the pipe entering and leaving the manhole, etc. Pipe shall be properly aligned with connections to manholes, etc. as shown on the construction drawings.
- B. Cast-In-Place sections shall be as shown on the drawings and in accordance with Section 312000.
- C. Invert channels shall be smooth and accurately shaped to a semicircular bottom conforming to the inside of the adjacent sewer section. Invert channels and structure bottoms shall be shaped with cement mortar. Changes in size and grade of invert shall be made gradually and evenly. Changes in direction of the sewer entering branch or branches shall have a true curve of as large a radius as the manhole will permit.
- D. Frames and Covers:
  - 1. Frames and covers shall be set to the proper elevation. The frames shall be firmly embedded in mortar approximately 1 inch thick and aligned to fit the top section of the structure.
  - 2. Bricks set in mortar used to adjust the frame to finished grade shall be limited to no more than four courses.
  - 3. Adjustment rings used to make adjustments in grade shall be made with the initial ring embedded in mortar and the exterior of the rings parged with mortar not less than 1/2 inch thick. No adjustment made in this manner shall exceed 8 inches.
- E. Concrete cradles shall be constructed as shown on the construction drawings and as needed when crossing over and under sewer pipe or utility lines. Concrete is to be 3000 psi mix with a minimum thickness of 6 inches.

### 3.06 SUBDRAINS

- A. Subdrains shall be installed in accordance with the details and at the locations shown on the construction drawings

### 3.07 INSPECTION AND TESTING

- A. General
  - 1. Storm sewer systems and culverts, upon completion or at such time as directed, shall be cleaned, inspected and tested. The system or culvert shall have a true grade and line. Actual elevations shall be within 0.08 feet of the elevations given on the construction drawings.
  - 2. After completion of the Work, or any part thereof, the job shall be tested to determine that it has been installed in accordance with the construction drawings

and specifications. In general, the Work shall prove to be in good condition, installed in accordance with the construction drawings and specifications and ready for use.

**B. Cleaning and Testing**

1. The contractor is to visibly inspect and remove all debris and obstructions from storm pipe. All storm pie is to be tested for infiltration and exfiltration by hydrostatic testing per ASTM C969. All manholes and pipe shall meet ASTM C969 leakage criteria.

**C. Alignment Test**

1. After backfill has been placed and compacted to a depth not less than one foot above top of pipe, a visual inspection shall be made by flashing a light between manholes. Any displacement or misalignment of invert shall be corrected.

**END OF SECTION 334100**

\\langan.com\data\PAR\data2\101053201\Project Data\Specifications\FOR BID\334100 Storm Drainage.docx

## SECTION 334200 - SANITARY SEWAGE SYSTEMS

### PART 1 GENERAL

#### 1.01 SECTION INCLUDES

- A. Sanitary sewer drainage piping, fittings, accessories, cleanouts, and bedding.
- B. Connection of site sanitary sewer system to municipal sanitary sewer systems.

#### 1.02 RELATED REQUIREMENTS

- A. Section 312000 - Earthwork
- B. Section 334300 - Sewer Manholes, Frames, and Covers
- C. Construction Drawings

#### 1.03 REFERENCE STANDARDS

- A. American Society for Testing and Materials (ASTM) latest edition
  - 1. D1784 Rigid Vinyl Compounds
  - 2. D1785 PVC Plastic Pipe, Schedule 40, 80, and 120
  - 3. D2466 PVC Plastic Fittings, Schedule 40
  - 4. D2564 Solvent Cements for PVC Pipe and Fittings
  - 5. F1668 Procedures for Buried Plastic Pipe
  - 6. A74 Cast Iron Soil Pipe and Fittings
  - 7. A746 Ductile Iron Gravity Sewer Pipe
  - 8. C12 Practice for Installing Vitrified Clay Pipe Lines
  - 9. C150 Portland Cement
  - 10. C207 Hydrated Lime for Masonry Purposes
  - 11. C425 Compression Joints for Vitrified Clay Pipe and Fittings
  - 12. C478 Precast Reinforced Concrete Manhole Sections
  - 13. C564 Rubber Gaskets for Cast Iron Soil Pipe and Fittings
  - 14. C700 Vitrified Clay Pipe, Extra Strength, Standard Strength, and Perforated
  - 15. C828 Recommended Practice for Low-Pressure Air Test of Vitrified Clay Pipe Lines
  - 16. D2141 Poly (vinyl Chloride) (PVC) Pressure-Rated Pipe (SDR Series)
  - 17. D2657 Heat-Joining Polyolefin pipe and Fittings
  - 18. D3034 Type PSM Poly (Vinyl Chloride) (PVC) Sewer Pipe and Fittings
  - 19. D3035 Polyethylene (PE) Plastic Pipe Using Flexible Electrometric Seals
  - 20. D3139 Joints for Plastic Pressure Pipe Using Flexible Electrometric Seals
  - 21. D3212 Joints for Drain and Sewer Plastic Pipes Using Flexible Electrometric Seals
  - 22. D3261 Butt heat fusion Polyethylene (PE) Plastic Fittings for Polyethylene Plastic pipe and Tubing
  - 23. F477 Electrometric Seals (Gaskets) for Joining Plastic Pipe

- C. American Water Works Association (AWWA) latest edition
  - 1. C111 Rubber-Gasket Joints for Ductile Iron Pressure Pipe and Fittings
  - 2. C600 Ductile-Iron Water mains and Their Appurtenances
  - 3. C900 Polyvinyl Chloride (PVC) Pressure pipe, 4 in. Through 12 in,  
for Water Distribution (NOT APPLICABLE FOR THIS PROJECT)
  - 4. C901 Polyethylene (PE) Pressure pipe, Tubing and Fittings  
1/2 inch through 3 inches, for Water Distribution (NOT APPLICABLE FOR THIS PROJECT)
  - 5. C906 Polyethylene (PE) Pressure Pipe and Fittings, 4 inch through 63  
inch, for Water Distribution (NOT APPLICABLE FOR THIS PROJECT)

#### 1.04 QUALITY ASSURANCE

- A. An independent testing laboratory or consultant selected and paid by the Contractor, will be retained to perform construction testing on site under observation of the Engineer.

#### 1.05 SUBMITTALS

- A. Product Data: Provide data of pipe materials, pipe fittings, and accessories per Section 011100.
- B. Manufacturer's Certificate: Certify that products meet or exceed specified local requirements.

#### 1.06 PROJECT RECORD DOCUMENTS

- A. Accurately record actual locations of pipe runs, connections, cleanouts, and invert elevations and provide As-Built drawings signed and sealed by a NJ licensed surveyor.
- B. Identify and describe unexpected variations to subsoil conditions and location of uncharted utilities.

#### 1.07 PROJECT CONDITIONS

- A. Coordinate work with termination of sanitary sewer connection outside building and connection to municipal sewer utility service.

## **PART 2 PRODUCTS**

#### 2.01 SEWER PIPE, FITTINGS, AND JOINTS (Exterior to Building except as noted)

- A. Polyvinyl Chloride Pipe (PVC): ASTM D 1785, rated Schedule 40 unless otherwise specified by the utility company. Pipe shall be continually marked with manufacturer's name, pipe size, cell classification, schedule rating, and ASTM D 1785 classification.

1. Pipe fittings shall conform to ASTM D 2466.
  2. Trace Wire: Magnetic detectable conductor (#12 copper), brightly colored plastic covering, imprinted with "Sanitary Sewer Service" in large letters.
- B. Ductile Iron Pipe (DIP): ASTM A746, Class 52, inside nominal diameter as specified on Construction Drawings, bell and spigot end.
1. Ductile Iron Pipe Joint Device: AWWA C111, rubber gasket joint devices.

## **2.02 PIPE ACCESSORIES**

- A. Pipe Joints: Mechanical clamp ring type, stainless steel expanding and contracting sleeve, neoprene-ribbed gasket for positive seal.
- B. Fittings: Same material as pipe molded or formed to suit pipe size and end design, in required tee, bends, elbows, cleanouts, reducers, traps, etc.

## **2.03 CLEANOUTS AND MANHOLES**

- A. Precast concrete manholes section shall conform to Section 334300.
- B. Lid and Frame: Provide traffic grade and rated covers and frames where cleanouts and manholes are within pavement, with letter in accordance with the municipal and or sewer treatment authority, where applicable, cast into the cover.
- B. Shaft Construction: Cast Iron shaft of internal diameter as specified on Construction Drawings with 3500 psi concrete collar for cleanouts.

# **PART 3 EXECUTION**

## **3.01 EXAMINATION**

- A. Verify that trench cut and excavation is ready to receive work and excavations, dimensions, and elevations are as indicated on Construction Drawings.

## **3.02 PREPARATION**

- A. Hand trim excavations to required elevations. Correct over excavation with bedding material.
- B. Remove large stones or other hard matter that could damage pipe or impede consistent backfilling or compaction.

## **3.03 BEDDING**

- A. Excavate trench and place bedding material in accordance with Section 312000.

## **3.04 INSTALLATION - PIPE**

- A. The type and class of pipe used shall be as shown on the construction plans. Pipes shall be laid and maintained to the required line and grade with necessary fittings, bends, manholes risers, cleanouts and other appurtenances placed at the required locations. The pipe shall be installed with uniform bearing under the full length of the barrel of the pipe. The pipe shall be inspected for defects and cracks before carefully being lowered into the trench. Any defective, damaged or unsound pipe, or any pipe that has had its grade disturbed after laying shall be taken up and replaced. Commence installation at lowest point with the bell end upgrades.
- B. No pipe shall be laid in water or when trench conditions are unsuitable for work.
- C. Pipe connecting to manholes or other structures shall terminate flush inside of the structure wall.
- D. Joints for PVC and CISP shall be thoroughly lubricated with an approved lubricant before pipe sections are slipped together. Open ends shall be fully protected with a stopper to prevent earth or other material from entering the pipe during construction. Carefully free interior of the pipe from dirt, cement and other deleterious material as the work progresses.
- E. Maintain separation of potable water main for sewer piping (10 foot horizontal and 18 inches vertical minimum) or as directed by the Engineer. Provide concrete encasement where less than minimum separation vertical is available per construction drawings.
- F. Route pipe in straight line parallel to roads, buildings and adjacent utilities and as shown on construction drawings.
- G. Establish elevations of buried piping with sufficient cover as recommended by pipe manufacturer to ensure not less than 3 feet of cover, except as noted on drawings.
- H. Form and place concrete for thrust blocks at each elbow of pipe force main. See construction drawing for details of construction.
- I. Backfill trench in accordance with Section 312000.
- J. Install trace wire continuous over top of non-metal pipe. Bury 6 inches minimum below finish grade, above pipeline.

### 3.05 INSTALLATION – CLEANOUTS AND MANHOLES

- A. Form bottom of excavation clean and smooth to correct elevation.
- B. For cleanouts form and place cast-in-place concrete base pad, with provision for sanitary sewer pipe to be installed to proper elevations.
- C. For manholes construct inverts according to the following guidelines:
  - 1. Invert channel shall be smooth and accurately shaped to a semicircular bottom to match with the inside of the adjacent sewer section.
  - 2. Invert channels and structure bottoms shall be shaped with mortar and lean concrete.

3. Changes in size and grade of invert shall be made gradually and evenly.
4. Changes in the direction of the sewer entering branch or branches shall have a true curve of as large a radius as the manhole will permit.

- D. For manholes provide manhole rings, frame and cover as shown on the construction drawings.

### 3.06 FIELD QUALITY CONTROL

- A. Pipes and joints shall not be completely backfilled until after inspection, testing, and approval by the Owner.
- B. Prior to testing for leakage, the pipe trench shall be backfilled to at least the spring line of the pipe. If required to prevent pipe movement during testing, additional backfill shall be added leaving the pipe joints uncovered to permit inspection.
- C. Exfiltration Test
1. Each section of sewer line between successive manholes shall be tested by closing the lower end of the sewer to be tested and the inlet sewer of the upper manhole, using stoppers.
  2. Fill the manhole and pipe with water to a point which produces a maximum of 3 feet of head above the invert of the sewer at the center of the upper manhole; or if ground water is present, 3 feet of head above the average adjacent ground water level.
  3. The allowable leakage shall be:
    - a. 50 gal/inch of pipe diameter/mile/day
- D. Infiltration Test
1. If excessive ground water is encountered in the construction of a section of the sewer, the exfiltration test shall not be used.
  2. The upper and lower ends of the sewer to be tested shall be closed sufficiently to prevent the entrance of water.
  3. Pumping of ground water shall be discontinued for at least 3 days; then infiltration shall be tested.
  4. Infiltration into each section of sewer between adjoining manholes shall not exceed that allowed for the exfiltration test.
- E. Provide measuring devices, meters, water, materials, and labor for making the required tests.
- F. Gravity systems shall be air tested between manholes at 3.5 psi for 5 minutes per ASTM F 1417 for plastic pipes. The Infiltration Test may be limited to the manholes only when the authority having jurisdiction does not require the test and the construction manager waives the test. The Infiltration Test will always be required when excessive ground water is encountered in addition to the air test.

- G. Tests shall be conducted in the presence of the Owner or his designee. Test data shall be submitted to the Engineer for review and approval.
- H. All force main piping shall be hydrostatically tested at 150 psi in accordance with AWWA C 600.
- I. If deflection test is to be run using a rigid ball or mandrel. It shall have a diameter equal to 95 percent of the inside diameter of the pipe. The test shall be performed without mechanical pulling devices.
  - 1. Allowable Deflection: Maximum allowable pipe deflection shall not exceed 5 percent of nominal inside diameter.
  - 2. Mandrel: Mandrel, go/no-go, device shall be cylindrical in shape and constructed with either 9 or 16 evenly spaced arms or prongs. Mandrels with fewer arms will be rejected as not sufficiently accurate. Contact length of mandrel's arms shall equal or exceed nominal inside diameter of sewer to be inspected. Critical mandrel dimensions shall carry tolerance of 0.01-inch maximum. Contractor shall provide mandrel and necessary equipment for mandrel test.
  - 3. Procedure: Mandrel shall be hand-pulled through flexible pipe sewer lines no earlier than 30 days after trench has been completely backfilled. Sections of sewer not passing mandrel shall be uncovered and rebedded, rerounded, or replaced to satisfaction of Owner or governing agency at no cost to Owner. Repaired section shall be retested.

**END OF SECTION 334200**

## SECTION 334300 - SEWER MANHOLES, FRAMES, AND COVERS

### PART 1 GENERAL

#### 1.01 SECTION INCLUDES

- A. Monolithic concrete manhole barrel with either monolithic concrete or masonry transition to lid frame.
- B. Modular precast concrete manhole barrel with tongue-and-groove joints with either precast concrete or masonry transition to lid frame.
- C. Precast polyethylene manhole assemblies.
- D. Preparation and installation of lid frame, covers, anchorage, and accessories.

#### 1.02 RELATED SECTIONS

- A. Section 312000 - Earthwork
- B. Section 334200 - Sanitary Sewer Systems
- C. Section 334100 - Storm Drainage
- D. Construction Drawings

#### 1.03 REFERENCE STANDARDS

- A. American Society for Testing and Materials (ASTM) latest edition
  - 1. A 48 Gray Iron Castings
  - 2. C 55 Concrete Building Brick
  - 3. C 478 Precast Reinforced Concrete Manhole Sections and Steps
  - 4. C 923 Resilient Connectors Between Reinforced Concrete Manhole Structures and Pipes
  - 5. D 1248 Polyethylene Plastics Molding and Extrusion Materials
- B. International Masonry Industry All-Weather Council (IMIAC) latest edition
  - 1. Recommended Practices and Guide Specification for Cold Weather Masonry Construction
- C. State Department of Transportation (DOT), Construction and Material Specifications, Latest Edition

#### 1.04 SUBMITTALS

- A. Shop Drawings: Indicate reference to Construction Drawings of manhole locations, elevations, piping with sizes, locations, and elevations of penetrations.

- B. Product Data: Provide data for manhole covers, manhole steps, component construction, features, configuration, and dimensions.
- C. Contractor shall submit shop drawings for the Engineer's approval as per Section 2000 1.08.

## **PART 2 PRODUCTS**

### **2.01 MATERIALS**

- A. Manhole Barrel: Reinforced precast concrete in accordance with ASTM C 478 with gaskets in accordance with ASTM C 923.
  - 1. Construct manholes of precast concrete sections as required by Construction Drawings to size, shape, and depth indicated, but never less than 4'-0" inside diameter.
- B. Concrete Brick Units: ASTM C 55, Grade N Type I-moisture controlled, normal weight, of same grade, type and weight as block units, nominal modular size of 3 5/8-inches x 7 5/8-inches x 2 1/4-inches
- C. Manhole Barrel: Precast polyethylene in accordance with ASTM D 1248. Manholes shall be manufactured with factory-molded steps. Nominal cylinder internal diameter shall be 48-inches and shall be designed to accept concrete filled polyethylene manhole lids and standard cast iron frames with lid or grate. Manholes shall have compressive strength that meets ASTM D 2412 standards. Acceptable Manufacturers: Advanced Drainage Systems (ADS) or approved equal.
- D. Mortar and Grout: Mortar for finishing and sealing shall be Class "C". Honeycombing less than 2-inches deep shall be repaired using Class "D" mortar.
- E. Brick Transition Reinforcement: Formed steel 8-gauge wire with galvanized finish.

### **2.02 COMPONENTS**

- A. Lid and Frame: ASTM A 48, Class 30B heavy duty cast iron construction, machined flat bearing surface, removable lid, open as indicated on Construction Drawings, sealing gasket, minimum total weight of 475 pounds manufactured by Campbell Foundry, Neenah Foundry Company, East Jordan Iron Works, or approved equal.
- B. Manhole Steps: Shall be formed aluminum rung (3/4 inch minimum diameter) or steel reinforced polypropylene, 12 inches wide, 12 inches on center vertically (maximum) set in manhole wall.

### **2.03 CONFIGURATION**

- A. Barrel Construction: Concentric with eccentric cone top section.
- B. Shape: Cylindrical
- C. Clear Inside Dimensions: 48-inches diameter minimum or as indicated on Construction Drawings.

- D. Design Depth: As indicated on Construction Drawings.
- E. Clear Lid Opening: 24-inches minimum
- F. Pipe Entry: Provide openings as indicated on Construction Drawings
- G. Main and Lateral Pipes: Neatly cut off main and lateral pipes flush with inside of manhole or inlet where they enter structure walls. Point up irregularities and rough edges with non-shrink grout. All pipe penetrations shall utilize A-LOK gaskets as manufactured by Atlantic Concrete Products, or equal. **DO NOT MORTAR EXTERIOR OR TOP HALF OF PIPE.**
- H. Inverts: Shape inverts for smooth flow across structure floor as indicated on Construction Drawings. Use concrete and mortar to obtain proper grade and contour. Finish surface with fine textured wood float.

### **PART 3 EXECUTION**

#### **3.01 EXAMINATION**

- A. Verify items specified by other Sections are properly sized and located.
- B. Verify that built-in items are in proper location and ready for roughing into work.
- C. Verify that the excavation for manholes is correct.

#### **3.02 PREPARATION**

- A. Coordinate placement of inlet and outlet pipe or duct sleeves as indicated on Construction Drawings.

#### **3.03 PLACING PRECAST MANHOLE BARREL SECTIONS**

- A. Place base pad to proper elevation and location and trowel top surface level for placement of manhole barrel.
- B. Place manhole barrel plumb and level to correct elevations and anchor to base pad.
  - 1. After completion of slab foundation, lower first joint of manhole barrel into position, grooved end first, and set level and plumb on concrete base. Align and adjust to proper grade prior to placing and forming invert. Pour invert immediately after setting of first section of manhole barrel.
  - 2. Prior to setting subsequent manhole barrel sections, apply primer to tongue and groove ends and allow to set in accordance with manufacturer's recommendations. Place "Ram-nek", or equivalent, plastic rope on tongue end. Lower next section into position, and remove excess material from interior of structure. Add additional material on exterior of joint, if necessary, for completely watertight joint.

- C. Set cover frames and lids level without tipping, to correct elevations. Utilizing pre-cast rings, or brick and mortar may achieve final rim elevation. Maximum limit, 4 courses.
